Public Comment: A major component of redevelopment, and perhaps source of your new riders, would come from residential redevelopment. This would appear to require average residential rents of about $2500/month. This is about twice the current highest Reston apartment rents, size for size. There is also an on-site, dispersed affordable housing requirement. Reduction of market rate rents to accommodate affordable housing will require an increase or subsidy by the remaining market rate rent payers. Required rents are also about 30% higher than current asking rents, per square foot, from individual owners at Stratford House, a luxury condominium at Reston's Town Center. This project currently partake of all Town Center amenities and does not overlook the Dulles Access/Toll Road or future rail.

1. What assumptions did you make concerning affordable housing?
2. What assumptions did you make concerning the requirement for noise abatement for high-rise apartments? (0449, 0449-E –4)

***Response**: The traffic analysis conducted as part of the Final EIS did not contain this level of detail. Assumptions about affordable housing were not needed in order to prepare inputs into the traffic analysis, which refined regional projections by adding new growth in the Metrorail station areas to the regional transportation network. Chapter 6 in the Final EIS presents a discussion of the methodology used in the traffic analysis.*

Noise was assessed in the Final EIS, but not for future development projections. The noise analysis used Federal Transit Administration (FTA) guidelines for three land use categories: Category 1, serene parks or other outdoor uses where quiet is an integral part of its use; Category 2, residential, which includes all single- and multi-family buildings; and Category 3, institutional, such as schools and churches. Project noise levels were determined using the FTA guidelines and WMATA criteria. Chapter 4 of the Final EIS includes a discussion of the methodology and assumptions employed in the noise analysis.

Public Comment: Maximum redevelopment to permitted amended master plan densities also require hotels as a part of the component. Reston currently supports only two hotels, with a third currently planned for Reston's Town Center.

1. How many hotel rooms did you assume in total?
2. Did you assume a hotel in each sub-unit as required for mixed-use redevelopment?
3. If so, how many rooms were assumed in each sub-unit? (0449, 0449-E –5)

***Response**: The development analyses conducted in Chapters 5 and 9 of the Final EIS did not contain this level of detail. Chapter 5 of the Final EIS presents an in-depth discussion of the methodologies used to determine the development effects of the Project. Chapter 9 presents the potential secondary development that may occur because of the Project.*

Public Comment: The amended master plan contains a "Non-degradation Policy" for rail high-density options. This requires transportation or other guarantees to maintain levels of service. With specific regard to the 17 acres, part of Sub-Unit G-4 (Wiehle Avenue TSA), it appears necessary to accommodate parking for at least 5,000 cars (including 2,300 as identified as transit parking as identified in your Draft EIS). Presently there are accommodations for about 1,100 cars (including 825 on the commuter lot). Questions:

1. How can an increase of about 4,000 cars on-site be accommodated without degradation of the level of service on adjacent roadways?
2. If additional traffic lanes are deemed required, how many are there and where are they located? (0449, 0449-E –6)

***Response**: The analysis did not contain this level of detail. This level of detail was not needed in order to prepare inputs into the traffic analysis conducted, which refined regional projections by adding new growth in the Metrorail station areas to the regional transportation network. Transportation effects of the Project and the methodologies used to estimate the effects are presented in Chapter 6 of the Final EIS.*

Public Comment: Conclusion: According to your Draft EIS, highest density options for rail were used as assumptions for Reston redevelopment, and in turn for your ridership forecasts. The Master Plan Amendment permitting this raises as many questions as it answers. Those enumerated above need to be answered to give credibility to the ridership forecasts in your Draft EIS. (0449, 0449-E –7)

***Response**: The travel demand forecasts in the Draft EIS were based on the Metropolitan Washington Council of Governments' (MWCOG) Round 6.2 Cooperative Land Use Forecasts. The Round 6.2 forecasts represented the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun County. Travel demand forecasts in the Final EIS were based on the MWCOG Round 6.3 Cooperative Land Use Forecasts, which represent the regionally adopted population and employment forecasts through 2030. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS.*
The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002)*. Chapter 5 of the Final EIS does present an analysis of the potential effects of increasing densities on the level of development as a result of the two Build Alternatives. The effects of implementing density bonuses in the corridor at Metrorail station areas is also quantified and presented in Table 5.3-1. In addition, density bonuses were included in the analysis of secondary development effects that is presented in Chapter 9 of the Final EIS in relation to traffic. This analysis was included in the Final EIS in order to address comments about the need to quantify the potential effects of increased density on traffic at Metrorail station areas.*

Public Comment: What pressures will be put on public services due to the increase density around the stations? (0147, 0459-L –16)

***Response**: If a local jurisdiction allows an increase in density, there will be additional demand for public services from the local government involved. Chapter 3 in the Final EIS identifies one specific impact to emergency services as a result of the Project. An increase in traffic congestion in the vicinity of the Fairfax County Fire Company #25 could affect egress and access to the station. The Fire Company currently has a pre-emptive traffic signal to control the flow of traffic.*

Need for Further Explanation of Environment Effects

Public Comment: What will be the specific secondary and cumulative effects of development at the proposed densities around the rail stations? What resources, either from WMATA or by the county, will be required to mitigate these potential for adverse secondary cumulative effects? What financial resources will be required? Who will be - where will we get the resources for this revenue? (0147, 0147-T –8)

***Response:** The secondary development effects of the Project alternatives as they relate to population, employment, and residential and commercial development around station areas are summarized in Table 9.3-1 of the Final EIS. The table also summarizes the predicted development characteristics if the LPA was not implemented, i.e., the effects of the No Build Alternative. Chapter 9 also presents a discussion of the potential secondary effects of development on growth patterns, traffic, and visual characteristics. However, it should be noted that since the predicted character of development is highly speculative and based on how*

development would occur under circumstances similar to today, it is difficult to specify the exact secondary effects of development at the proposed densities surrounding the stations.

Four potential resource areas where cumulative effects may be of concern were identified and evaluated in the cumulative effects analysis. These include: water resources, air quality, historic resources, and resources protected under Section 4(f). If the Project was not expected to impact a certain resource, then it was not considered as contributing to cumulative impacts to that resource.

Any secondary or cumulative effects to the built and natural environment resulting from additional station area development would be mitigated through compliance with Fairfax and Loudoun Counties' land use policies and development permitting processes.

Public Comment: The Council on Environmental Quality's regulation defines cumulative effects as the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-federal) or person undertakes such other action (40 CFR 1508.7). The DEIS failed to include sufficient information about impacts to neighborhoods but not define these impacts is a major defect in the DEIS. A lack of a more complete community impact analysis indicates that the project team determined that the cumulative impacts were insignificant. However, there is a lack of evidence in the DEIS which supports this analysis. (0147, 0459-L –19)

***Response**: An analysis of cumulative effects, as defined by the commenter, is included in Chapter 9 of the Final EIS and presented in detail in the Economics and Secondary Development Effects Technical Report (June 2002). In addition, a full community impact assessment was conducted for every neighborhood not only within proximity to the Metrorail stations and along the corridor, but also for any neighborhoods projected to experience an increase in traffic volumes or noise effects. The detailed impacts to neighborhoods and community resources as a result of the Project are included in Chapter 3 of the Final EIS. They are also summarized in Table 3.2-3 of the same chapter. The use of the 300-foot buffer and half-mile radii at the Metrorail station areas resulted in the inclusion of numerous neighborhoods in the corridor that were evaluated for impacts. Few actual impacts have been identified, other than noise and traffic impacts for the vast majority of neighborhoods assessed. Since the alternatives are located primarily within existing transportation rights-of-way, there are few neighborhood and community impacts, in comparison to other alignments on new locations that could include numerous residential displacements. Few cumulative impacts are projected as well.*

Public Comment: It is proposed that the rail line along Reston will be wall to wall office buildings. The DEIS does not address the impact of wall to wall office buildings along the rail line. What impact will they have on the character and aesthetics of Reston? What impact would it have on the social and political make up of the community? What financial impact would they have on the community? What impact would it have on our property values? What are alternatives to heavy density? What positive impact would increased density have on the community? What is the tax impact on the community to include the poor, retired and the elderly? What impact would the daily commuters have on Reston on utilizing restaurants and businesses? What impact would the increase in residents have on the community? On the Reston Association? On schools? On police and fire responses? (0189, 0448-E –5)

***Response**: Chapter 5 of the Final EIS presents an analysis of the potential effects of increasing densities on the level of development as a result of the two Build Alternatives. The effects of implementing density bonuses in the corridor at Metrorail station areas is also quantified and presented in Table 5.3-1. In addition, density bonuses were included in the analysis of secondary development effects that is presented in Chapter 9 of the Final EIS in relation to traffic. This analysis was included in the Final EIS in order to address comments about the need to quantify the potential effects of increased density on traffic at Metrorail station areas.*

An analysis was also conducted to determine the effects of the Project on output, earnings, employment, and tax revenues. The analysis, however, was not specific to the poor, retired, or the elderly, but rather to the counties directly impacted by the Project. This analysis is presented in Chapter 5 of the Final EIS.

The commenter identifies several issues related to the increase in density. While they are important considerations for Fairfax County to consider, they are not specifically related to this Project. However, the direct effects of the Project on neighborhoods and community resources were evaluated in Chapter 3 of the Final EIS (see Table 3.2-3). As part of the neighborhood and community analysis the following issues were evaluated: changes in population and employment; community cohesion and interaction; isolation effects; social values – social groups valued or harmed; barrier effects; noise and vibration; physical intrusions; access changes; community facility impacts, which includes hospitals, parks, places of worship, day care centers, schools, government offices, police and fire stations, cultural centers, and special service providers; displacements; safety; and property values adjacent to Metrorail stations. From a cumulative effects perspective, there is not a causal relationship between the two Build Alternatives and many of these issues.

Public Comment: What are the traffic increases projected if various alternatives are selected? For instance, metro stations attract more businesses and more housing, thus increasing traffic around the stations and areas - a neverending circle. (0235, 0235-E –8)

Response: *The effects of the Project alternatives on regional and local roadway facilities are presented in Chapter 6 of the Final EIS. The 2025 peak-hour traffic volumes and levels of service (LOS) on selected highway links throughout the Dulles Corridor are shown in Table 6.2-2. LOS reflects the impacts of congestion experienced by vehicles traveling along a road or through an intersection. Projected delays in seconds at key intersections in the corridor and the corresponding LOS were also assessed for the Project alternatives.*

Public Comment: The second thing we have to do, I requested a few times the county transportation staff taking a look at this issue, rather than just the land use people looking at it. In fact, I got so frustrated I got myself a transportation consultant who did an analysis. There are 13 plan amendments pending in Tysons Corner, and I asked him to take a look at the amount of trips per day that this 13 plan amendments would produce. They would produce 111,000 new trips per day in Tysons Corner. Also I suggested that you find out how many metro trips would come from that other station, because we're in Tysons Corner. Sixteen thousand new transit trips a day on metro out of this 111,000. Another 16,000 would be internal. That's about 32,000 trips out of 111,000 that would be carried by a system that would - to get into Tysons Corner it would cost almost $2 billion. The other 78,000 trips would be on the road. That's not a happy thought. (0136, 0168-T –3)

Public Comment: The proposed redevelopment of the commons is based on rail through Tysons. The density that is being proposed will be approximately seven to 10,000 apartments. Even with 30 to 35 percent ridership, which is the number being used by Washington Metro - and even that's being optimistic - that still means another 5 to 7,000 cars in Tysons Corner. (0159, 0159-T –2)

Public Comment: Additionally, I have grave concerns with the information that I have been able to read in this brief amount of time. Bonus densities that would be granted around the metro stations do not appear to have been considered in the traffic calculations. The most optimistic projected non-single occupancy vehicular ridership for growth around the new metro stations is estimated to be 20 to 30 percent. That translates into 70 to 75 percent of the residents using the area roads. Tysons is currently a congested and a miserable drive during peak hours. If the current level of service in this area is failing, retaining an F grade does not mean that there is not change of road conditions with no relief from increased densities. (0179, 0179-T –6)

Public Comment: The last one, you know, back in December I thought it might be interesting to go to the planning commission of Fairfax County and suggest that they take those 13 plan amendments that

are pending in Tysons Corner and say, hey, you know, maybe building those rail stations is not necessarily going to take care of all those trips created by those 13 plan amendments that are pending at Fairfax County pending the outcome of this EIS and rail station in place. And I was turned away. And the Fairfax County transportation staff has never done an analysis of the impact of transit rail stations and this development that's being proposed in Tysons Corner. Now I took it upon myself to get a transportation consultant who is well known in this region to do an analysis, and he concluded that those 13 plan amendments would create 111,000 new trips in Tysons Corner per day, and 16,000 of those, according to this consultant, would go use Metro. Another 16,000 would go internally. And 78,000 would be new trips on the road. And I'm still waiting for the county to do their own transportation - you know, we pay millions and millions of dollars to the transportation staff that we have in the county, and I think they're very competent, but it's time to let them loose, let them do their job. This is not a land use program. This is supposed to be a transportation program, the largest public works project in the history of Fairfax County. And the least we should do is have the transportation people in Fairfax County, the staff, our staff, the ones we pay for, take a look at it. Because I have information which I am sure the folks at the table up there have, that just putting rail stations at Tysons Corner is not necessarily going to hack it. (0136, 0136-T –3)

Response: *The travel demand forecast results used in the Final EIS analyses of roadways and transit service (see Chapter 6) are based on the MWCOG Round 6.3 Cooperative Land Use Forecasts. These forecasts represent the regionally approved and adopted population and employment forecasts through 2030 for the region, including Fairfax and Loudoun counties. By federal regulation, such regionally approved forecasts must be used in the analysis of the two Build Alternatives. Model assumptions must be consistent among the alternatives so as to not bias the results of the travel demand forecasting process.*

In fact, land use development patterns often do react differently depending on the type and mode of transportation in a given corridor, due largely to local policies that may encourage transit-oriented development around major transit nodes. Subsequent to the adoption of the Round 6.3 Forecasts, Fairfax and Loudoun counties amended their respective land use plans (Fairfax County Comprehensive Plan and Loudoun County Revised General Plan) to permit additional residential, retail, and office development around Metrorail stations. These amendments and their impact on corridor land use and population and employment are discussed in detail in the Final EIS in Chapters 3, 5, and 9. Density bonuses were included as part of the analyses included in Chapter 5. The travel-related effects of this additional, or secondary development are summarized in Chapters 6 and 9 of the Final EIS. However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). All current land use plans and zoning ordinances were reviewed for the evaluation of land use impacts (see Chapter 3). Pending plan amendments and development proposals, as referenced in the comments, that have not been adopted by the local government are not included in the analysis.

Public Comment: And what assurances do the surrounding neighborhoods have that they won't be overwhelmed by a greatly increased human and traffic density, without adequate infrastructure in place? (0159, 0159-T –4)

Response: *The local governments have control over the actual level of development that will be approved and there are triggers included in the land use regulations that have been adopted to mitigate the infrastructure effects of the additional growth. County regulations allow the clustering of future development in locations that are best able to support that development in terms of providing transit, pedestrian, and bicycle access to residents and employees. In the future, the counties may limit development at station areas if necessary to mitigate any associated impacts*

to the surrounding community. Chapter 9 presents the potential secondary and cumulative effects of the Project alternatives.

Public Comment: Another thing I wanted to touch on tonight was something very deep in a technical report. The report is called "Traffic Analysis and Station Access Study Technical Report." It reported on the secondary impacts of land use, and in the corridor the Fairfax supervisors had a task force that recommended mixed use development around the four stations here, and in May of 2001 the county board actually adopted these recommendations, and these were fed into the analysis. And the results were really astounding. They show that if you do plan land use to be related to the new transportation investment, you do get some significant changes in behavior. For instance, just without considering Loudoun County, their data was not - and they have changed their comp plan, too, but their data was not fed into this analysis. The projected ridership grows from 86,700 to 101,000, and the new riders grow to 54,000. Even more to the point, the number of new transit riders increase by 43 to 45 percent, depending on what alternative is used for Tysons Corner. (0141, 0167-T –3)

Response: *If density bonuses were included in the Draft EIS model forecasts, total ridership would have increased from 86,900 to 101,100 for the Alignments T6 and T9. New riders also would have increased from 38,300 to 54,400 for Alignments T6 and T9. Secondary development impacts of the alternatives brought forward into the Final EIS are presented in Chapter 9 of the Final EIS. Density bonuses were included as part of this analysis. Chapter 6 includes an analysis of the transportation effects, including ridership and new riders, of the Project alternatives. However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Public Comment: The EIS does not appear to adequately address the traffic that will result from the density bonuses, i.e., growth, planned for land adjacent to future transit stations. If you consider that at the very most 30 percent of those in new residential developments might use transit for work commuting, that means that the other 70 percent will not. Where will all those cars go? What will be the corresponding impacts on highway noise and congestion? (0145, 0145-T –12)

Public Comment: That we don't know enough about bonus density impacts on congestion in neighborhoods around transit stations. (0446, 0146-T –8) (0446, 0218-M –8)

Public Comment: Specifically, the process should be stopped until steps are taken for the draft EIS to include a detailed quantitative analysis of the impact increased traffic and increased development will have on these residential areas. (0454, 0454-E –2)

Public Comment: To achieve the proposed density opportunities around stations, there will be an increase in traffic congestion. For example, under the metrorail option at Wiehle Avenue, there is an option to have 4,244,065 square feet of residential use. This results in 3536 dwelling units. If 25% of the people in these units use some transit mode other than a single occupancy vehicle, one can predict that 75% or 2652 people will not. The DEIS provided only a superficial analysis of the community impact of the additional traffic generated around stations. In addition, the analysis zone was too restricted. (0147, 0459-L –21)

Response: *The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

The impacts of congestion due to density bonuses are generally discussed Chapter 9 of the Final EIS . The overall level of development expected to occur as a result of the density bonuses in the Metrorail station areas is quantified in Chapter 5 of the Final EIS. The projected level of growth and related traffic and other effects were assessed. All neighborhoods within a half-mile of the Metrorail stations were analyzed to see if they would experience an increase in cut-through traffic or other traffic impacts due not only to the construction of the transit alternatives, but also due, in part, to the increase in traffic associated with the development. The specific neighborhoods included as part of the analysis are listed in Table 3.2-1 of the Final EIS. Direct impacts due to Project alternatives on neighborhoods in the study area are described in Chapter 3. Impacts to traffic at key intersections in the vicinity of the station areas are presented in Chapter 6.

Public Comment: There will be increased density at these station areas. More retail, more office development, more residential, and in some areas, hotel use. For example, under the metrorail option at Wiehle Avenue, today there exists 521,000 square feet of residential use. Based on the new comprehensive plan that was recently adopted, this bonus density credit plan, the projections would make metrorail options, there could be up to 4,244,000 square feet of residential. That's at the Wiehle Avenue station. Now if we wanted to calculate this and turn it into dwelling units, we could have 3500 dwelling units. Now if 25 percent of the people from these units use some transit mode, which means that they did not get in a single-occupancy vehicle, what will the 75 percent or 2652 other people do? To conserve time for the other two stations, with the projected residential use, it will total almost 7 million square feet. Then we can readily expect an addition of about 7000 cars added to our present mix. By VDOT standards, 2700 cars equals three lanes of traffic. (0147, 0177-T –4)

Response: *Localized traffic congestion is projected to occur at the Metrorail station areas, due not only to the provision of transit services, but also due to the increase in densities. The effects of this congestion are discussed in Chapter 9 of the Final EIS. As stated in that chapter, the local jurisdictions will ultimately determine the actual level of development allowed in the future. Further, there are triggers in place designed to mitigate the infrastructure effects of the additional growth.*

Public Comment: Density projections need to be realistically assessed and the impact of the increased growth needs to be included in the projections. (0150, 0150-T –10)

Response: *The potential changes in the level of development in the corridor is assessed and quantified in Chapter 5 of the Final EIS. The analysis in the Final EIS projects potential development at the Metrorail station areas. The projections were based on the continuation of the positive market conditions within the corridor and predict that much of the development potential allowed in local comprehensive plans would be achieved. For many of the parcels evaluated, it was also projected that full density bonuses due to proximity to Metrorail stations and the inclusion of housing would be allowed. An analysis of the potential effects of implementing density bonuses in the corridor at Metrorail station areas in the study area and is also included in Chapter 9 of the Final EIS.*

However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Public Comment: Let the new jobs, shopping and housing move farther out. That will ease congestion, the sensible, natural way. It appears that the real motivation for rail is to aid the businesses and property owners in Fairfax County. (0155, 0155-T –3)

Response: *The primary goals of the Project are not only to support future development, but also to improve transportation service; increase transit ridership; support environmental quality; provide cost-effective, achievable transportation solutions; and serve diverse populations. The two Build Alternatives of this Project were designed to meet those needs. The purpose and need for the Project is stated in Chapter 1 of the Final EIS and the specific goals and objectives of the Project are listed in Table 1.6-1.*

Public Comment: The EIS does not appear to adequately address the traffic that will result from the density bonuses-growth-planned for land adjacent to future transit stations. If you consider that at the very most 30 percent of those in new residential developments might use transit for work commuting, that means that the other 70% will not. Where will all those cars go? What will be the corresponding impacts on highway noise and congestion? Only a systematic approach that considers how the impacts of a change in one part of the system will affect the whole system can have credibility. We feel that this EIS lacks credibility where it addresses environmental impacts. (0145, 0452-E –9)

Response*: Localized traffic congestion is projected to occur at the Metrorail station areas due to the increase in density and as drivers access the stations, as specified in Chapter 9 of the Final EIS. A systematic approach was used to define these impacts. The potential increase in density in Fairfax was modeled to define traffic impacts and transit ridership effects and acknowledges that this growth will generate additional vehicular traffic (traffic impacts directly related to the Project alternatives are presented in Chapter 6). However, mitigation for this increase in traffic due to the increase in densities at the Metrorail station is incorporated into local land use regulations, as defined in Chapter 9 of the Final EIS. The local governments have incorporated language in their comprehensive plans that would limit the level of development if congestion were projected.*

Public Comment: On the quality of life, the rail as projected will have a devastating impact and change our community forever. As you so stated it will result in increased localized traffic congestion and in poor air quality. In addition, it will result in pedestrian and traffic safety problems, increased crime, and serious delays in ambulance, fire and police responses. Furthermore, we have a significant increase in density such as Wiehle Avenue which would be increased over 986 percent and Reston Parkway area almost 268 percent. Moreover, we will have a cannon of office buildings along the rail line effectively dividing our community like the Great Walls of China. Also, along with these buildings will come an army of commuters projected to be over thirty thousand, who will overtax our roads, restaurants, and other facilities. Not to mention that these buildings in the evening will be nothing but an empty ghost town. (0189, 0201-L –3) (0189, 0189-T –3)

Response: *The effects of the Project alternatives on neighborhoods and community resources are summarized in Table 3.2-3 of Chapter 3 in the Final EIS (see Table 3.2-3). No adverse impacts on pedestrians are predicted. On the contrary, pedestrian bridges across existing roadways are planned for several of the Metrorail stations, thus improving pedestrian access and providing better safety. The congestion is only projected to affect one emergency service community facility, Fairfax County Fire Station #25 on Wiehle Avenue. The development effects of the Project are discussed in Chapter 5 of the Final EIS. The secondary and cumulative effects on neighborhoods due to the increase in development are analyzed in Chapter 9 of the Final EIS.*

It should be noted that the 986 percent increase in population at Wiehle Avenue Station in Table 9.3-4 of the Draft EIS is largely a statistical anomaly, since the overall increase is due more to the lack of any residential development than a large volume of total residential development. In addition, the increase in residential development at the Metrorail station is allowed under the comprehensive plan in Fairfax, because it provides a greater opportunity for non-auto dependent development to occur. Residential development in close proximity to transit generates much fewer trips on the road system than other forms of development.

Public Comment: Relate the projected land use density near the stations to specific impacts on schools and arterial roadways. This information is necessary for public to determine the projected community impacts. (0147, 0459-L –13)

> ***Response****: As a result of implementation of the LPA, the intensity of development in station areas could increase. The potential increase in population and employment near stations would create an additional strain on community facilities and services, such as schools and arterial roadways. However, under the No Build Alternative, the population and employment within the Project area is projected to increase and would also cause a strain on these facilities and services. More information on potential development effects is included Chapter 5 of the Final EIS. The influence of the Project on development outside of station areas is discussed in Chapter 9.*

Public Comment: The DEIS reports an increase in traffic volume at stations and parking spillovers at certain stations. The recommended mitigation measures include truck access and circulation planning, lighting, control plans and landscape buffering. Treatment of community impacts was handled in a very superficial manner. Therefore, there should be further analysis with more specificity and with identification measures that will address the traffic shifts and overflow parking concerns. Again the geographic study area must be expanded to include feeder streets and neighborhood streets surrounding the transit stations. Without analysis and reporting of findings, the DEIS fails to meet the recommendation to report cumulative effects. (0147, 0459-L –20)

> ***Response****: Impacts to neighborhoods, communities and community services were assessed using techniques described in the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation. Chapter 3 of the Final EIS provides the methodology used to assess neighborhood, community services and community cohesion impacts. Transportation related impacts are discussed in Chapter 6 of the Final EIS. The process used to evaluate secondary and cumulative effects is based on the guidance provided in the Federal Highway Administration Technical Advisory, Guidance for Preparing and Processing Environmental and Section 4(f) Documents (1987).*

Public Comment: The key to reducing traffic congestion with higher density development is for total vehicle hours to be reduced by an amount to more than compensate for the higher automobile demand created by the increase density. Based on the proposed density levels for each station area, what is the automobile demand created? What is the anticipated vehicle hours per capita for each of the station areas based on density opportunities? To reduce traffic congestion in the Tysons Corner and Reston areas by 25 percent what percent reduction per capita vehicle hours would be required? (0147, 0459-L –33)

> ***Response****: The analysis to estimate the traffic impacts of increased density allowed with the implementation of rail was completed for the Draft EIS but new analysis was not completed for the Final EIS. The data are shown in Chapter 22 of the* Traffic Analysis and Station Access Study Technical Report (June 2002) *completed for the Draft EIS. The data produced for the Draft EIS do, however, provide a reasonable understanding of the impacts of increasing densities per the density bonuses allowed for rail. The data is presented for the three areas in Fairfax County where density bonuses are allowed: Tysons Corner, East Reston, and Reston/Herndon. Traffic will increase in each of the areas where density bonuses are allowed, relative to conditions where no rail line is built and therefore no additional density is allowed. In Tysons, vehicle miles traveled would increase in the range of 2.5 percent, in the eastern Reston in the range of 7 percent and in Reston/Herndon in the range of 9 percent.*

Public Comment: The DEIS stated that this [increased densities] will lead to traffic congestion. I believe this is an understatement. Nowhere does it address the number of commuter vehicle traffic coming into Reston daily, which could be easily 22,000, nor does it address an additional 6,000 to 8,000 vehicles from new residents. The only mitigating factor addressed regarding increased congestion is to add turn lanes on Wiehle Avenue. What impact would this traffic have on Reston? Such as: air quality, pedestrian safety,

timely responses of emergency vehicles? How would it impact on the side street parking and traffics? Where will the commuters park? How will they handle such traffic congestion? (0189, 0448-E –4)

> ***Response**: All of the neighborhoods located near station facilities could experience increases in traffic and longer, more frequent queuing. One fire station, Fairfax County Fire Company #25 at the intersection of Sunrise Valley Drive and Wiehle Avenue could be affected by these conditions. Increased vehicular traffic in stations areas could affect pedestrian safety. In most instances, on-street parking limits are enforced by local jurisdictions. Chapter 3 of the Final EIS addresses effects on neighborhoods, community services and community cohesion. Further discussion of traffic related effects, including parking, is provided in Chapter 6 of the Final EIS. No long-term impacts to regional air quality are anticipated from the construction and operation of the Project. Air quality effects are discussed in Chapter 4 of the Final EIS.*

Public Comment: Quantify the increased traffic, and its impact, from development generated by the availability of rail service. (0392, 0392-L –5)

> ***Response**: While it is expected that increased density would result in localized traffic congestion in station areas, the new, transit-oriented urban form related to the Wiehle Avenue Extension would help to increase overall mobility in the corridor, the counties, and the region. More detailed information pertaining to traffic increases and potential mitigation is provided in Chapter 6 of the Final EIS. Station area characteristics and development potential within the Dulles Corridor are discussed in Chapter 5 of the Final EIS.*

Public Comment: How will the increased residential development densities in Reston, that are a major feature of the project, impact school boundaries for neighborhoods to the east and south of Reston? (0460, 0460-L –7)

> ***Response**: No information on school boundaries is presented in the Final EIS because it is outside the scope of this Project and is unrelated to the selection of a transit alternative in the Dulles corridor. Local governments are responsible for any decisions related to school boundaries.*

Public Comment: How will the more intense commercial and residential development in Reston affect traffic volumes and safety on local roads such as Sunset Hills, Hunter Mill, Crowell, Browns Mill and Beulah Roads which are used by commuters as an alternate to the Dulles Toll Road connection between Reston and Tysons Corner? Will this development generate traffic that overwhelms minor arterials and create pressure for road widening? (0460, 0460-L –4)

> ***Response**: As specified in Chapter 9 of the Final EIS, traffic increase related to the increase in density will contribute to localized traffic congestion primarily located within the Metrorail station areas. Sunset Hills Road is projected to have an increase in traffic at the Metrorail station area and the other roads specified may also support additional trips. However, additional capacity or improvements needed to accommodate new growth associated with the density bonuses and not specifically caused by the provision of transit are the responsibility of the local jurisdiction and the Virginia Department of Transportation. More detailed discussion of traffic related effects and mitigation is provided in Chapter 6 of the Final EIS. However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Public Comment: The Draft EIS fails to assess the impact on the character, infrastructure, and financial resources of communities throughout the corridor in a meaningful way. The focus of the analysis should

be placed on social and community character and infrastructure, and the direct, secondary, and cumulative impacts. (0510 9-1)

Public Comment: The evaluation of development projections in the Draft EIS is unduly subjective. The approach used (relying on professional judgment in determining development projections) undermines the reliability of the Draft EIS. A more clear explanation of methodology is needed. (0510 9-8)

> ***Response:*** *Secondary and cumulative effects are presented in Chapter 9 of the Final EIS. The process used to evaluate secondary and cumulative effects is based on the guidance provided in the Federal Highway Administration Technical Advisory, Guidance for Preparing and Processing Environmental and Section 4(f) Documents (1987). Chapter 9 of the Final EIS further describes the methodology used.*

Public Comment: The Draft EIS makes no effort to assess or advance the principles of sustainable development. It should do so, apart from whatever requirements NEPA imposes. (0510 9-7)

> ***Response:*** *It is not within the authority of the Project Team to advance the principles of sustainable development, nor would it be appropriate for the Final EIS to advocate any particular form of development. Implementation of the principles of sustainable development is under the control of the local jurisdictions in the study area. Some elements of sustainable development, such as implementation of transit-oriented development, are included and analyzed in Chapter 5 of the Final EIS, as appropriate.*

Public Comment: The Draft EIS does not address the impact of increased density on the environmental resources described in Chapter 4. (0510 9-6)

> ***Response:*** *Chapter 9 of the Final EIS describes the potential effects of secondary development on elements of the human and natural environment. Long-term effects on these resources are presented in Chapters 3 and 4, respectively.*

Public Comment: Section 9.4, Cumulative Effects, does not include enough detail. It simply states that all projects/alternatives are likely to have minor effects to environmental resources. A drive on the Toll Road between Hunter Mill Road and Route 7 shows that this statement is incorrect. (0510 9-5)

> ***Response:*** *Section 9.4 of the Final EIS describes the cumulative effects of the No Build, LPA and relevant, reasonably foreseeable actions that could contribute to cumulative effects. Based on coordination with the Federal Aviation Administration, one reasonably foreseeable action was identified, the Dulles Airport Runways Project. Four resources were identified for evaluation: water resources, air quality, historic resources and Section 4(f) resources. Technical analysis conducted for the Final EIS determined that the LPA would not result in major impacts to the resources identified and therefore, would not contribute substantially to potential cumulative effects related to other relevant, foreseeable projects, such as the Dulles Airport Runways Project.*

Clarification of Travel Patterns

Public Comment: Also the reverse commute market, the analysis shows that of the new transit trips, nearly three-quarters of them would be coming in the reverse direction, helping to balance out use of the metro system, making a much more efficient use of a rail system, rather than have it be all in one direction. And this is because of the increasing employment in the corridor, as well as the opportunity to walk to work. As a matter of fact, the analysis showed that at the Reston Parkway station, with mixed use, you have a tripling of pedestrian activity, 461 walking and biking trips to 1187. (0141, 0167-T –4)

> ***Response:*** *Secondary development near station areas would support the reverse commute market through the increase of employment densities near stations.*

Need Linkage Between Increased Density Measures and Mitigation Measures

Public Comment: We are afraid that the county will zone increased density but road mitigation measures or metrorail will be delayed or never happen. We therefore recommend approval of increased density zoning only when mitigation measures are actually implemented and funds are not only approved but are released for the operating segment that includes the Mid Corridor service. Higher density facilities should be timed to coincide or follow the arrival of metrorail and road mitigation measures. (0170, 0170-T –17)

> ***Response:*** *As stated in Chapter 3 of the Final EIS, all current land use plans and zoning ordinances were reviewed for the evaluation of land use impacts. The plan language adopted by the local government identifies that bonuses are eligible once a full funding grant agreement has been obtained. The Project Team will work with the local government to develop mitigation measures and to support transit usage in the corridor; however, the approval of site-specific projects and regulation of the form and timing of development is under the jurisdiction of the local governments in the area.*

Need to Integrate Transportation Planning and Land Use Planning

Public Comment: We also have some concerns about the DEIS and the planning it reflects. This is a complex project. In order for it to succeed, it will be necessary to consider and coordinate all the elements. This includes assuring that the kind of land use planning that will bring about the quantity and quality of development, that will make the project viable, occurs. Now we have heard repeatedly that these departments do not do land use planning, this is a local government function, and that you use COG, whatever, plan -- system to plan. We know that, but frankly we think that much more can and must be done. The agencies involved prepare transportation analysis with the use of models, and these models incorporate a definition of the surrounding land use. There is nothing preventing you from preparing scenarios of the alternative land use patterns over time to demonstrate to local planners what the result of these patterns will have on transportation factors. (0158, 0158-T –3)

Public Comment: This is a complex project and in order for it to succeed, it will be necessary to consider and coordinate all the elements. This includes assuring that the kind of land use planning that will bring about the quantity and quality of development that will make the project viable occurs. Now we have heard repeatedly that you do not do land use planning, that this is a local government function and that you use the COG round-whatever to plan. We know that, but frankly we think that much more can and must be done. (0158, 0223-M –2)

Public Comment: The agencies involved prepare transportation analyses with the use of transportation models, and these models incorporate a definition of the surrounding land use. There is nothing preventing you from preparing scenarios of alternate land use patterns over time to demonstrate to local planners what the result of these patterns will have on transportation factors. You should certainly work with local planners and citizens in defining what alternatives to analyze. This is not planning, it is providing your expertise to assist decision makers on these complex issues. It will constitute integration of land use and transportation planning, which is a mandate of the regional plan and it can be part of an EIS. (0158, 0223-M –3)

Public Comment: Traffic Impacts Resulting from Increased Density that can be Granted Near Rail Stations: If the rail alternative is built, landowners can be granted increased density near the rail stations. If this density is built, there will be additional automobile traffic because not everyone will ride the rail system. Further, these projects may be built long before the rail system is completed. This traffic increase is a direct impact of the rail alternative and, therefore, must be considered in the impact analysis. The EIS should be revised to discuss the traffic impacts of all density increases along the Dulles Corridor that could be implemented if rail is built, including both existing and proposed density bonuses. The EIS should discuss the impact of this additional automobile traffic in Tysons Corner. (0392, 0392-L –17)

Public Comment: Metrorail allows the highest densities of the station areas of any options and will generate the greatest ridership, but unless substantial mitigation efforts are made, there will be major congestion at the station areas. This congestion could easily spread throughout Reston. We understand that the current traffic analysis includes traffic at all stations due to metro, but not traffic due to the increased authorized densities. This raises doubts about the adequacy of the recommended mitigation measures. The final EIS traffic analysis should include the increased densities with and without mitigation measures. Mitigation measures should result in no more congestion than the no-build alternative. (0170, 0170-T –16)

> ***Response:*** *The Comprehensive Plan and the General Plan for Fairfax and Loudoun Counties, respectively, provide for existing development characteristics and density bonuses at the proposed new Metrorail station locations. Station area characteristics and development potential are discussed in Chapter 5 of the Final EIS. Chapter 6 addresses proposed mitigation measures for transportation effects related to LPA. However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).
> *It should be noted, however, that the increase in traffic associated with the density bonus would be mitigated through the counties in coordination with the Virginia Department of Transportation. In Fairfax County there is a non-degradation clause in its Comprehensive Plan that will be used to measure the traffic impact of the increased density. Thus, mitigation of traffic impacts due to density increases rests with the counties.*

Public Comment: But overall, we can build the rail system that will work here, that can focus development, can save open space, can maximize traffic ridership and reduce traffic congestion. I think we have made good progress. I think a lot of good public comments are coming in, and indicating we need to do a lot more on the land use side, though. (0149, 0180-T –14)

Public Comment: In conclusion, we support rail provided we get the land use right and provided we get the best routing in Loudoun. Let's build the rail system that can focus development, save open space, maximize transit ridership, and reduce traffic congestion. (0149, 0205-M –5)

Public Comment: The metrorail alternative, with our recommended modifications, will help keep Reston a vital and thriving community. (0170, 0170-T –18)

> ***Response:*** *Under the No Build Alternative, the density bonuses would not be triggered and development would continue to be driven by market conditions throughout the corridor. This would likely lead to a dispersed pattern of development and would be highly auto-oriented, leaving people with few travel choices. Implementation of the LPA would help focus development in and around station areas.*

Growth Needs to be Tied to Ensuring Quality of Life

Public Comment: It is, therefore, essential that we carefully plan for our region's growth in a manner that promotes our quality of life. This plan includes the wise use of our region's diminishing development land, the preservation of our air and water quality, and the provision of rail and roadway corridors along which high-density, smart growth development can be channeled to help reach these ends. (0142, 0142-T –4)

Public Comment: As the growth of our region's economy and population is both desirable and inevitable, these policies will help ensure an excellent quality of life by sustaining a vital economy, by preserving our urban areas, and by protecting our natural environment. Moving forward with the Dulles Corridor Rapid Transit Project as soon as possible will help our region meet these goals. (0142, 0142-T –7)

Response: *The Dulles Corridor is a vibrant, diverse mix of businesses, neighborhoods, recreational amenities and an international airport that continues to attract population and employment growth at almost twice the rate of the region. The central and eastern portions of the corridor currently experience some of the region's worst traffic congestion. An investment in efficient and reliable transportation facilities to meet the travel needs will contribute to the area's economic, social, and environmental quality.*

Transit Ridership Benefits Significantly by Transit-Oriented Development

Public Comment: For those who have not had a chance to read the "Traffic Analysis and Station Access Study Technical Report," I want to note the beneficial impact of the recent changes to the Fairfax County Comprehensive Plan adopted by the Board of Supervisors. This analysis did not include anticipated transit-related development at the stations in Loudoun County because County staff has not yet developed comparable data. The total ridership for the four-station Tysons Corner alignment is forecast to be 86,900, of which 38,300 are new riders. The same analysis done using the transit-related growth forecasts projects 101,100 total riders, of which 54,400 are new riders. This represents an 18 percent increase to total Corridor ridership and, most notably, the number of new transit riders increased by 43-45 percent depending on the alternative selected for Tysons Corner. (T-4 has the largest increase because it has the most stations in Tysons Corner.) The increase in new riders result in an improvement in the cost-effectiveness of the Metrorail investment. This highlights the dramatic relationship of land use to the transportation investment and the need to "get it right" this time. (0141, 0443-E –13)

Public Comment: Another table indicates that of the nearly 27,100 work trips forecast under the transit-relate growth scenario, more than 20,400 trips (74 percent) originate from outside of the Corridor, indicating that rail in the Dulles Corridor would help to support a growing reverse commute market. As the report states "an important benefit of increased employment densities around Metrorail stations in the Dulles Corridor would be the utilization of excess capacity on a.m. outbound and p.m. inbound trains, which would result in more transit passengers being carried without an increase in operating costs, and consequently, an improvement in project cost effectiveness. (0141, 0443-E –14)

Response*: The analysis, to which the commenter refers, was completed for the Draft EIS but was not re-analyzed during completion of the Final EIS. The data produced for the Draft EIS do, however, provide a reasonable understanding of the impacts to ridership of increasing density in areas where density bonuses are allowed after implementation of rail. As noted in the response, both total riders and new riders increase with the implementation of the density bonuses, thus supporting the density bonus concept.*

Use of High Density Land Use Projections in Measuring Ridership

Public Comment: Because the Dulles Rail (NVMISM) Model makes overly optimistic assumptions of rail ridership based on pie-in-the-sky projections of high density land use at projected rail stations, for argument purposes, will not consider those "transit-related growth forecasts," just the "regionally approved forecasts" that are not dependent on high density land use (See pages 379-391, "Traffic Analysis and Station Access Study-Technical Report." My reasons for this are as follows:

1. Master Plan Amendment rail density at key "sub-units" is greater than BRT density. Comparable assumptions about the impact of transit on ridership will automatically favor rail, since rail density is higher.
2. The study does not appear to break out that portion of ridership projections which is the result of redevelopment.
3. All maximum density increases written into the plan require a residential development component with minimums and maximum (maximum up to 75%), also a non-residential component that includes office, hotel, and support retail. Is it likely even by 2025 that the Wiehle/Dulles Road crossing by itself would support three or four hotels with probably a minimum of 750 rooms? As read the planning document it does not appear that a hotel is an option, it's a requirement.

4. With the exception of the 17 acres including the present commuter lot, existing development would appear to have a useful life well beyond 2025, with values much greater than land value even assuming maximum redevelopment and $35/floor area required (FAR) square footage for land. Hence the assumption of maximum redevelopment in place and generating trips by 2025 is not realistic.
5. Required apartment rents on the aforementioned 17 acres would appear to be about $2500/month today. This would increase for market rate apartments as necessary to subsidize the required on-site dispersed affordable housing component. Will there be 1,000 renters at this level? If there are condos will buyers accept proximity to current 12 lanes of traffic and a rail lane? Will renters?
6. Master Plan Amendment appears to require maintenance of current transportation systems (I.e. roads, I assume) at predevelopment levels. I can't see how this is possible, particularly for the 17 acre site with the addition of a net of nearly 700,000 sq. foot office space, 1,000 apartments, and a transit station.
7. Air Rights over freeways is virtually non-existent. The only place I have found urban blocks built above a freeway is on the Cross Bronx Expressway in New York. Developers I have spoken to say that it is expensive to build over a freeway due to high insurance costs. Plus, in light of terrorism, I doubt few people will want to build tall buildings above a freeway. All of the above are factors in my conclusion that the density forecast is unlikely in the time frame given; if not realized but used for ridership projections, the latter are high. (0112, 0462-L –22)

> ***Response****: Growth projections for the Metrorail station areas are presented in the Final EIS and reflect the regionally adopted land use projections, as prepared by the Metropolitan Washington Council of Governments, and the density bonuses permitted by local governments. The economic effects of station area development are discussed in Chapter 5 of the Final EIS. The projected development totals are presented as a form of worst-case scenario in that the level of projected development is close to build-out in some sections of the corridor. In developing these projections, the Project Team did not go to the level of detail identified in these comments by projecting specific projects in specific locations that would define the specifics of redevelopment feasibility, rental prices, or a detailed evaluation of the specific requirements adopted in the Comprehensive Plan language. The projections were developed from calculating build-out for the general areas included in the Metrorail station area and do not include such items as air rights development and are more general than the information requested by the commenter. Once build-out was determined, the level of growth was projected based on general assessments of the percentage of growth that might occur and using a standard land use mix. As stated in the Final EIS, the actual level of growth might be much lower.*

Need to Apply Effective Methodologies to Measure Impacts

Public Comment: The cumulative and secondary effects were not adequately analyzed in the Draft EIS. The methodology is biased since it assumes that infill, joint development, and redevelopment are desirable and positive effects. In addition, the methodology is flawed because it underestimates the adverse impacts of the worst-case scenario by not describing the worst-case scenario. It only assumes that development will only proceed within the present parameters for density allowed under the Fairfax County Comprehensive Plan and the mix of uses permitted. The Draft EIS should apply various factoring tools to arrive at a more plausible worst-case scenario. For example, there is a demonstrated history of special exceptions to permitted uses, and changes to increase the allowed density, and other changes from what is allowable under the plan. A multiplier of 1.2 could be applied to reflect an assumption that for 20% of all parcels, county authorities will authorize more intense and dense usage than is currently allowed under the Comprehensive Plan. (0510 9-3)

Public Comment: Another shortcoming in the methodology for cumulative and secondary effects results because a quantitative methodology was used to evaluate effects in transit station areas but a qualitative methodology in assessing effects along regional transportation facilities. (0510 9-4)

> ***Response:*** *Secondary and cumulative effects are presented in Chapter 9 of the Final EIS. The process used to evaluate secondary and cumulative effects is based on the guidance provided in*

the Federal Highway Administration Technical Advisory Guidance for Preparing and Processing Environmental and Section 4(f) Documents (1987). Chapter 9 of the Final EIS further describes the methodology used.

Public Comment: The Draft EIS does not differentiate between the BRT alignment options when discussing the secondary and cumulative effects of the BRT Alternative. It also does not describe the intense pressure that would be borne by the low-density residential neighborhoods between Reston and Tysons Corner. The pressure exerted by increased car traffic to avoid tolls, and nearby density at the Wiehle Avenue Station is not discussed. (0510 9-2)

Response: *BRT was eliminated from further consideration after the public and agency review and comment on the Draft EIS. Chapter 9 of the Final EIS discusses the secondary and cumulative effects of the LPA.*

B. Supplemental Draft EIS Comments

Public Comments

Increase Development May Result in More Traffic Congestion

Public Comment: I really feel like the rail will increase overdevelopment in Reston.
0071 0080-4

Public Comment: [A]any economic benefits incurred from subsequently added residential communities or businesses will be accompanied by more intra-Reston congestion, overcrowding, environmental damage and higher taxes.
0105 0123-4

Public Comment: Rail to Wiehle or rail to Herndon or Dulles will not solve the local traffic problem. Reston was not designed to move traffic. It is not a grid system. It was a nicely developed town or place where people could go from their house to work.
0073 0083-1

Public Comment: With the volume of traffic on Toll Road I find it hard to believe we need to increase density around the rail route!
0030 0031-2

Response: *The analysis of development potential is discussed in Chapter 5 of the Final EIS and presents a discussion of the potential effects of density bonuses in the corridor at Metrorail station areas, including Reston. Secondary effects of potential development are discussed in Chapter 9 of the Final EIS. The actual level of development within the corridor are under the control of local government. Any mitigation needed to support the increase in densities is also under the jurisdiction of Fairfax and Loudoun counties, and they have included measures in their land use regulations.*

Public Comment: The facts are rail will not only NOT help the congestion but will in fact increase the congestion. It has been recognized and stated in the DEIS and the SDEIS and in fact, I submit, there will be serious increases of the congestion in this region just because of continued as planned development and that does not even consider the doubling and tripling of densities near proposed rail stops that are scheduled to be allowed when the agreement for funding is reached.
0107 0125-9

Response: *Over the next twenty years, congestion in the Dulles Corridor and the region will be increasing due to population and employment growth, regardless of the Dulles Corridor Rapid Transit Project. The Project would provide an alternative mode of transportation within the region. While it is stated in the Final EIS that the Project alone would not eliminate congestion on the*

Dulles Toll Road and other regional roadways, the Project would substantially increase the transportation capacity of the Dulles Corridor.

Changes in Development Intensity

Public Comment: The impact on the current development in Tysons Corner would be great. The next step would be an effort to markedly increase the intensity of development along the Route 7 corridor.
0102 0119-2

Response: *The actual level of development within the corridor is under the control of local jurisdictions. The level of development projected in the Final EIS represents the maximum allowable development under current zoning for the purpose of impact assessment. The timing and increase in densities in Tysons Corner is under the jurisdiction of Fairfax County. Chapter 5 of the Final EIS present an analysis of the potential effects of increasing densities and quantify the effects of implementing density bonuses in the corridor at Metrorail station areas. However, the Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Support for Transit Oriented Development

Public Comment: [Reston Association] supports mixed-use, transit-oriented development in the Wiehle station area consistent with the Fairfax County Comprehensive Plan.
0039 0040-7

Public Comment: [Reston Citizen's Association] supports mixed-use, transit-oriented development in the Wiehle station area, consistent with the Fairfax County Comprehensive Plan.
0040 0041-4

Public Comment: I strongly support the concept of planning for intensive, urban scale mixed use development allowing for significant residential, commercial, retail and public uses within a reasonable walking distance of the rail transit stations in the Dulles Corridor.
0041 0042-5

Public Comment: DCRA supports the location and design of rail stations so that the development of transit-oriented development (TOD) is encouraged.
0060 0169-3

Public Comment: The Committee for Dulles strongly supports the concept of planning for intensive urban-scale mixed-use development that allows for significant residential and commercial retail and public uses within a close proximity of these rail stations.
0067 0075-1

Response: *Implementation of the LPA would help focus development in and around station areas, contributing to a new transit-oriented urban form for the Dulles Corridor. Chapter 3 of the Final EIS describes the land use plans adopted by local governments within the Dulles Corridor, all of which contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the Metrorail stations. These recommendations have been adopted in the Comprehensive Plan of Fairfax County and the General Plan of Loudoun County, and would be implemented by the counties through application of their respective zoning ordinances.*

Clarify Development Assumptions Used in SDEIS

Public Comment: What quantity and mix of uses and activities within the impact area of the Wiehle Avenue station are or have been used in the supplemental DEIS?
0042 0043-4

> ***Response:*** *The regionally adopted land use and population forecasts developed by MWCOG (Round 6.2) were used in the Supplemental Draft EIS. In order to reflect the most current data, the Final EIS was updated to reflect the MWCOG Round 6.3 data. The future of land use at Wiehle Avenue under the Wiehle Avenue Extension and Full LPA would be similar to that described in Chapter 3 of the Final EIS.*

9.2 Cumulative Effects

A. Draft EIS Comments

No comments pertaining to this topic were received.

B. Supplemental Draft EIS Comments

Public Comments

More Detailed Information on Changing Development Character is Needed

Public Comment: b. The SDEIS needs to provide detailed explanation as to the contribution of the project to cumulative effect, particularly regarding the "Change in Development Character" east of Wiehle Avenue (e.g., TABLE 2-2). The geographic extent and type of change needs to be provided in detail in order to meet social impact assessment requirements of the NEPA process.
0068 0173-18

> ***Response:*** *Information provided in the secondary and cumulative effects discussion of the Supplemental Draft EIS was updated for the Final EIS to reflect coordination with the Federal Aviation Administration regarding proposed Dulles Airport improvements. Determining the cumulative environmental consequences of an action requires delineating the cause-and-effect relationships between relevant, reasonably foreseeable actions and the resources, ecosystems, and human communities of concern. One project, the Dulles Airport Runways Project was identified as having the potential to influence the cumulative effects analysis for the Dulles Corridor Rapid Transit Project. Chapter 9 of the Final EIS discusses the cumulative effects related to the Dulles Corridor Rapid Transit Project. This chapter also describes the methodology used in identifying sensitive resources and determining the area of effect for the secondary and cumulative effects analysis. More specific information pertaining to community effects is discussed in Chapter 3 of the Final EIS.*

9.3 Mitigation

A. Draft EIS Comments

State Agency Comments

Consider Environmentally Friendly Methods

State Comment: Consider environmental attributes when purchasing materials. For example, the extent of recycled material content, toxicity level, and amount of packaging should be considered and can be specified in purchasing contracts. (0407, 0407-A –14)

State Comment: Consider contractors' commitments to the environment (such as an EMS) when choosing contractors. Specifications regarding raw materials and construction practices can be included in contract documents and requests for proposals. (0407, 0407-A –15)

State Comment: Choose sustainable materials and practices for infrastructure and building construction and design. These could include asphalt and concrete containing recycled materials, and integrated pest management in landscaping, among other things. (0407, 0407-A –16)

> ***Response:*** *Construction of the LPA would adhere to industry standards and utilize Best Management Practices to minimize effects on environmentally sensitive resources identified. Consideration of environmentally friendly methods and materials will be given during preliminary engineering and final design.*

Public Comments

Consider Environmentally Friendly Methods

Public Comment: All build alternatives should address life-cycle environmental impacts of the required construction, types of transit equipment, and operation and maintenance of each design. (0487 9-1)

> ***Response:*** *The Final EIS included an analysis of anticipated effects of the LPA, which encompass many of these issues as required by the National Environmental Policy Act of 1969 (NEPA), as amended.*

Need for Further Explanation of Environmental Effects

Public Comment: Metrorail allows the highest densities at the station areas of any options, and will generate the greatest ridership, but unless substantial mitigation efforts are made, there will be major congestion at the station areas. This congestion could easily spread throughout Reston. We understand that the current traffic analysis includes traffic at the stations due to Metro, but not traffic due to the increased authorized densities. This raises doubts about the adequacy of recommended mitigation measures. (0210, 0210-M –10)

> ***Response:*** *Analysis of travel effects related to secondary development primarily focused on station area travel patterns in relation to ridership, transit mode share, pedestrian and bicycle trips, total person and vehicle trips, vehicle miles traveled, and traffic volumes at selected intersections. While it is expected that increased density will result in localized traffic congestion in station areas, the new, transit-oriented urban form related to the LPA would help to increase overall mobility in the corridor, the counties, and the region. Information pertaining to the potential development character and effects is discussed in Chapter 5 of the Final EIS. Transportation related effects are discussed in Chapter 6 of the Final EIS.*

Public Comment: The Final EIS traffic analysis should include the increased densities, with and without mitigation measures. Mitigation measures should result in no more congestion than the no-build alternative. (0210, 0210-M –11)

> ***Response:*** *A discussion of traffic-related impacts and mitigation is presented in Chapter 6 of the Final EIS.*

Mitigation Plan

Public Comment: Designate a managing entity to coordinate implementation of the mitigation plan and ensure compliance and reports to stakeholders. In the mitigation plan, designate the specific responsibilities of each agency, along with cost share, timeline, and monitoring. (0026 Francesca Bravo, Falls Church)

Response: *The Virginia Department of Rail and Public Transit (DRPT) is responsible for overall project management and implementation. It will be responsible for implementing mitigation measures included in the Federal Transit Administration's Record of Decision (ROD) for this Project. The ROD will be developed after the 30-day circulation period of the Final EIS. DRPT will prepare a mitigation monitoring plan to identify responsibilities for specific measures and track their completion.*

Public Comment: Ensure that the general project budget includes separate allocation to fund post implementation mitigation measures to address unanticipated adverse future effects of the project. (0430 9-2, Falls Church)

Public Comment: Ensure that the general project budget includes separate allocation to fund post implementation mitigation measures to address unanticipated adverse future effects of the project. (0388 9-2)

Public Comment: There is an inadequate mitigation plan, unclear mitigation responsibilities, and passing the buck between the Project and other local, state, and state transportation agencies. Conclusions on impacts and mitigation are very sketchy. (0430 9-1)

Response: *The Project will be responsible for mitigating Project-related impacts only. Mitigation for all impacts have been identified and developed as part of the Final EIS and will be finalized during preliminary engineering and/or final design. The overall Project budget will include monies for mitigation of Project-related impacts. The Federal Transit Administration's (FTA) Record of Decision (ROD) to be prepared after the circulation of the Final EIS will outline specific, agreed upon mitigation for the Project.*

Public Comment: Concerned about the construction and implementation of the Metrorail Alternative at Hallcrest Heights. Based on the responses provided, seems like the noise issues can be addressed and the commenter hopes that the Project Team will work with state and local governments to identify and fund necessary mitigation measures. (0141 9-1)

Response: *Chapter 4 of the Final EIS discusses noise impacts related to the Dulles Corridor Rapid Transit Project. The Hallcrest Heights neighborhood was identified as having a severe noise impact under both the Wiehle Avenue Extension and the full LPA. To mitigate the long-term noise effects from Metrorail operations on the Hallcrest Heights residential community, parapet and trackside sound barriers would be installed along the alignment at the locations shown in Figure 4.7-5 of the Final EIS.*

Public Comment: Coordinate with VDOT and Fairfax County regarding shared mitigation costs and measures for sound barriers, measures to address cut-through traffic. Mitigation measures for new noise and traffic impacts should be provided in the Final EIS and responsible agencies should seek programming in the Commonwealth and regional transportation plans. (0388 9-1)

Response: *Mitigation for Project-related noise and traffic impacts is proposed in the Final EIS and will be refined during preliminary engineering. Coordination with appropriate local government, and state and federal agencies regarding implementation of specific mitigation measures will occur as required.*

B. Supplemental Draft EIS Comments

No comments pertaining to the topic of mitigation were received.

10.0 EVALUATION OF ALTERNATIVES CARRIED FORWARD

10.1 Evaluation Relative to Project Goals and Objectives

A. Draft EIS Comments

Federal Agency Comments

Environmental Impacts Related Alternatives

Federal Comment: Environmental impacts of this proposal are minor and EPA has not identified any potential environmental impacts that would require substantive changes to any of the alternatives. The project is confined to existing right-of-way or is located on existing parking lots, streets and other developed lands. There are no residential displacements and up to only six commercial displacements associated with the alternatives. The Metrorail alternative is on the Metropolitan Washington Council of Governments (MWCOG) Constrained Long Range Transportation Plan (CLRP) and it conforms with regional air quality plans. Wetland and stream impacts are less than that associated with a typical residential development in the area. Noise, vibration, and visual impacts were the only significant issues identified in the DEIS and the DEIS identified ways to minimize and mitigate these impacts. (0303, 0303-A –1)

> ***Response:*** *Thank you for your comments. The Dulles Corridor Rapid Transit Project is included in both the current CLRP and the Transportation Improvement Program (TIP).*

Regional Agency Comments

Independent Market Research Shows Strong Desire of Residents and Employee to Use Transit

Regional Comment: Independent market research conducted through the Dulles Corridor Rail Association and paid for jointly by local interests and by the Virginia Department of Rail and Public Transportation, demonstrate that residents and employees in the Dulles Corridor have a "Lexus mentality" and an unusually strong desire to use a transit system if trip times, service standards and convenience are designed to meet their service oriented requirements. The market research results also demonstrate that the Dulles Corridor's reaction to transit differs from national transit norms. For example, the desire to use rail transit over the longer commuting distances increased with income for Dulles Corridor residents up to a household income of $200,000 per annum, after which it began to decline. (0133, 0405- L-10)

> ***Response:*** *Comment noted.*

Consideration of Additional BRT "Features

Regional Comment: Consider adding further BRT features to the existing express bus services where they can increase ridership, reduce trip times, or both. (0133, 0405- L-12)

> ***Response****: The express bus services currently running in the corridor are the responsibility of Fairfax and Loudoun counties, respectively. The Project Team has recommended that the existing transit service provided by Fairfax and Loudoun Counties be further enhanced beyond the bus rapid transit elements that have already been added. Prior to the opening of LPA Phase 1, additional bus rapid transit elements—including the expansion of the Herndon-Monroe park-and-ride lot (site of the future Herndon-Monroe Metrorail Station), ITS enhancements, and facility improvements—should be advanced.*

Local Agency Comments

Comparative Assessment of Alternatives

Local Comment: In order to provide a fair, comparative assessment of the rail alignments in Tysons Corner, a table or matrix should be included in the public hearing report that presents other factors, in addition to costs for each of the alignments. Other factors should include items such as construction impacts, maintenance of traffic impacts and operational issues. (0479, 0479-L –1)

> ***Response****: Table 2.7-4 in the Draft EIS presented the anticipated costs, impacts, and benefits of all alternatives under consideration for the Dulles Corridor Rapid Transit Project, including the No-Build Alternative. Table 10.2-1 presented the essential differences between alternatives, summarizing the trade-offs between the various alignments and modes.*

Station Activity During Off-Peak Period

Local Comment: Will Metro in the median perform well during rush hour, but travel virtually empty for the rest of the day? (0151, 0151-T –7) (0151, 0297-E –12)

> ***Response:*** *No. Estimates of total station activity (station boardings and alightings) for Dulles Corridor Metrorail stations during the peak period versus the off-peak show that peak activity would be between approximately 46to 63 percent of total daily activity. This shows that significant station activity would occur during the off-peak period.*

Public Comments

Comparative Assessment of Alternatives

Public Comment: The comparison of the rail out to Dulles with the BRT is not fair because the rail proposal also includes the extremely costly loop going through Tysons. If you break that out, if you just build the rail down the right of way, which was so wisely put there in the '50s, it's just a straight and simple task of rail laying, much like building the 10 miles in one day done by Crocker of the Central Pacific 133 years ago. The alignment is there, the right of way has been investigated, the footings are known. There are six bridges that are required. I will point out that that highway bridge that fell into the Oklahoma River on Memorial Day is 400 feet long and 140 feet up in the air, and it was closed today. (0083, 0192-T –3)

> ***Response:*** *The Draft EIS was not intended to present a comparison of nearly identical alternatives. It was intended to evaluate the relative merits and impacts of a small range of alternatives. Alignments that differ allow decision makers to better understand the benefits and costs of alternate approaches to providing improvements. The trade-offs identified for different alternatives may lead decision makers to ultimately select a preferred alternative that combines beneficial elements of each. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *The analysis presented in Chapter 10 of the Draft EIS showed that the Metrorail Alternative has several benefits relative to the BRT Alternative, even though BRT costs less and has greater cost effectiveness. In general, Metrorail provides greater improvements in transportation service; greater increases in transit ridership, more support for future development, and it would better serve diverse populations. BRT, on the other hand, provides improvements in corridor transit service sooner, has fewer impacts on the natural environment, fewer noise and visual impacts, and lower traffic impacts in the vicinity of stations (though still higher than the No-Build).*
>
> *In response to comments made following publication of the Draft EIS, the Project Team evaluated a new alignment option for the Metrorail Alternative that would provide for express service that bypasses Tysons Corner. The alignment would include a leg that extends along the median of the DIAAH on the north side of Tysons Corner.*

The analysis showed that the leg of the alignment extending along the median of the Dulles Connector Road and the DIAAH would be costly and would have substantial impacts. The alignment would have to be coordinated with the proposed interchange plans at the Capital Beltway. Because current plans consume the median in full, the Connector Road, the DIAAH, and the adjacent ramps would need to be shifted outward, likely resulting in substantial impacts on adjacent properties and residents.

A Spring Hill Road Station for Metrorail would also require shifting the DAAR outward because the current median is not wide enough to accommodate a standard-width Metrorail platform. Shifting the roadway would also require the costly widening of Spring Hill Road overpass bridges and reconstruction of an existing slip ramp between the DIAAH and the Dulles Road.

Given that a substantial portion of the demand for proposed Metrorail Alternative is for travel to and from Tysons Corner (approximately 40 to 50 percent), an alignment that effectively serves the employment concentrations and major activity centers within Tysons Corner will contribute significantly to the success of the Dulles Corridor Rapid Transit Project. An alignment that extends along the DIAAH and serves Tysons Corner via a Spring Hill Road Station would force a transfer for many travelers, degrading the level of service to Tysons Corner, increasing travel times for potential patrons, and thus reducing overall ridership on the line.

Public Comment: That most alternative comparisons provided are on the basis of opening year (2005, 2006 and 2010) and 2025. What's needed is an apple to apples comparison of all options for 2010. (0446, 0218-M –6) (0446, 0146-T –6)

Public Comment: Lack of Comparable Data for Key Out Years. Adequately assessing the value and cost effectiveness of heavy rail vs. alternatives requires comparable data for comparable years. The DEIS provides cost, ridership and other data based only on anticipated opening year of service and 2025. What's needed is comparable data for 2006, 2010 and 2015 to determine the benefit and value of different options in the short term. (0446, 0446-E –5)

Response: *A comparison of all the Draft EIS alternatives at the year 2010 would not be an "apples to apples" comparison, because at that point in time, the BRT and BRT/Metrorail alternatives would have been in operation for several years, whereas it would only be the first year for operation for the Metrorail Alternative. It often takes several years for new improvements to achieve their full potential. Once people have had time to see the benefits of the new improvement, often more people will opt to use it. Therefore, the opening year comparison of Metrorail to alternatives that have been in operation several years would not be a fair comparison. Rather, a comparison of each alternative in its respective opening year provided a better comparison.*

The best comparison, however, is for each alternative in a future horizon year—in this case, 2025. By that point in time, all alternatives would have had ample opportunity to "settle in" and analysis at this point likely represents the full potential of each.

The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Public Comment: I am a big fan of metro and I use it often to get to work. I reckon some kind of mass transit will be helpful for the Dulles Corridor, but it seems from my reading of the Draft EIS that you all are focusing primarily on the costs of the alternatives and not weighing them against their benefits. Have you calculated the cost/benefit ratio for each alternative? If so, where can I find them? If not, when do you plan to do them? It is hard for me to imagine how you can choose amongst the alternatives if you are only looking at the cost side of the equations. You need to estimate the financial benefit. (0117, 0117-E –4)

Public Comment: I think all of the options-build options seem to have merit and appeal, and it's clearly been well thought out. But in looking at the draft EIS, it's unclear if there's been any serious cost benefit analysis work done of each of the proposals, and I urge that to be done. And by that, I mean, we're not only-I mean, clearly all of the expenses have been well calculated for the various alternatives, and it's easy to compare all of them next to each other in terms of their cost. But more realistic picture is to try to also calculate the benefit that will be gained, both immediately tangible benefits where you can readily calculate the financial impact, as well as more qualitative benefits, but where financial assumptions and values are designed. But then for each of the alternatives, we ought to-we, the public, ought to be able then to look at them, when we're spending this kind of money, in terms of not only what their expenses will be, but what's the value of the benefit of each one, because we clearly should try to pick the one that has the greatest benefit relative to its cost, regardless of the total price tag be four billion, or 300 million. (0117, 0277-T –1)

Public Comment: Is the system cost-beneficial? I see no quantification of the benefits against which to weigh the costs. I see only a comparison among costs. (0166, 0166-T –1)

> ***Response:*** *Chapter 10 of the Draft EIS was essentially a cost-benefit comparison, because it described how each alternative performed against the stated project goals (the benefits), and evaluated the impacts of each alternative (the costs). This analysis included both quantitative and qualitative measures, and was not the type of conventional cost-benefit analysis suggested by several of the commenters. There are many benefits received from the Build Alternatives that are difficult to reflect in such a quantitative cost effectiveness analysis. Although the region will receive a financial benefit from developments and increased tax base, these financial benefits do not accrue to the project and a conventional cost-benefit analysis is not really instructional.*
>
> *For major transportation investments, an evaluation plan that relies exclusively on weighting schemes or cost analysis comparisons can be too rigid, making it difficult to compare attributes that are more qualitative or difficult to assign a cost value. Rather, an evaluation that clearly outlines performance relative to a project goals, and summarizes the essential differences between alternatives or the various trade-offs involved in selecting one over the other, is a more instructive and useful tool for decision makers.*
>
> *Construction costs and operating & maintenance costs are a significant issue, because they are used by the Federal Transit Administration, along with other measures, to evaluate the effectiveness of a project. However, the hard numbers for cost effectiveness and financial feasibility will not be the bottom line for selecting an alternative.*
>
> *Therefore, the analysis presented in Chapter 10 reflected not only the cost effectiveness of each alternative, but also each alternative's effectiveness in meeting more qualitative or non-monetary project goals, such as "supports future development," "supports environmental quality," and "serves low-income and minority populations." The final summary of the relative benefits and impacts of each alternative were outlined in Table 10.2-1 of the Draft EIS.*
>
> *The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: Transit is vital to the long term health and well-being of Northern Virginia. Environmental Defense supports transit as a centerpiece for building sustainable communities. Before committing to Metrorail, however, we need a better analysis of alternatives, ensuring that we receive the greatest value for our transit investment. (0444, 0444-E –6)

Public Comment: The Center is not opposed to Metrorail – to the contrary, we strongly support transit as one of the best means to reduce congestion, improve air quality, enhance quality of life, and effectively manage growth. Before investing billions in Metrorail, however, it is reasonable to expect a fair and

impartial analysis of the benefits and impacts of that investment as compared with other investments. Unfortunately, the Draft EIS does not come close to providing a fair and impartial analysis and is nothing more than a pretext to justify billions of dollars for Metrorail. (0445, 0445-E –2)

Public Comment: In short, the DEIS appears to have been pre-engineered to support conclusions that are beneficial to the project managers and the consultants. At the same time, the DEIS fails to provide analysis that would lead to cost-effective, near-term solutions that would actually solve our suburban transportation problem. (0138, 0476-L –1)

Public Comment: Transportation investment decisions should be based upon a fair assessment of performance, cost, environmental benefits, land-use issues, and other factors important to the community. The Draft EIS, however, does not come close to a fair assessment. Rather, the document is extraordinarily biased in favor of spending billions of dollars of federal and local funds on Metrorail, and does not provide any credible analysis to support this conclusion. Many of the assumptions in the document, particularly those related to system routing and design, are so flawed that objective analysis is impossible. (0445, 0445-E-1)

> ***Response:*** *The Draft EIS documented the systematic approach that was undertaken to assess the potential effects of the proposed alternatives. Each of the chapters and sections of the Draft EIS, which documented the effects of the project, documented the relevant laws and regulations considered, described the methodologies used, defined the study areas assessed, documented the existing conditions in the study areas, predicted the direct and construction related effects, and indicated mitigation measures available to lessen substantial impacts when predicted.*
>
> *As described more fully in other responses in Section 6.24, the BRT Alternative defined in the Draft EIS was an appropriate definition of BRT for the Dulles Corridor, given the conditions and constraints in the corridor. Though BRT applications in other cities have different route structures and capacities, the evaluation of a particular mode in a given corridor is dependent on a number of factors. In other cities, the same limitations on space and lane availability may not apply, therefore, the performance and capacities of these applications do not necessarily have relevance for the Dulles Corridor Rapid Transit Project.*
>
> *As described in Chapter 2 of the Draft EIS, BRT is an emerging transit mode in which buses are used to provide high-quality service akin to a rapid rail system. It is intended to provide rail-like service and amenities at a lower cost. Therefore, in the context of the Dulles Corridor, the BRT Alternative was developed to serve the same type of travel needs as the proposed Metrorail Alternative. The intent was to evaluate a lower-cost, lower-impact alternative to see if it could have provided the same level of benefit as a Metrorail Alternative.*
>
> *Both BRT and Metrorail were designed to primarily serve the east-west travel demand between existing and emerging activity centers along the Dulles Toll Road, and between these centers and the region's core. As described in Chapter 2, both were intended to function as an extension of the existing Metrorail system, taking advantage of the direct connection this system already provides to Arlington and the region's core. In the context of the Dulles Corridor Rapid Transit Project, BRT was meant to be a complement to the existing regional rapid transit system, not a competing regional system.*
>
> *As described in Chapter 10 of the Draft EIS, the cost effectiveness for the alternatives in the Dulles Corridor Rapid Transit Project was measured using the then Federal Transit Administration's uniform method for analyzing costs and benefits. This method reflected the relative benefits of the proposed improvements, in terms of the number of riders attracted to the system, as compared to the costs to construct and operate the improvements.*
>
> *Overall, the analysis presented in Chapter 10 reflected not only the cost effectiveness of each alternative, but also each alternative's effectiveness in meeting more qualitative or non-monetary project goals, such as "supports future development," "supports environmental quality," and*

"serves low-income and minority populations." The final summary of the relative benefits and impacts of each alternative was outlined in Table 10.2-1 of the Draft EIS.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Public Comment: Conclusion #1: Metrorail service will deliver the highest ridership (more than twice as much as BRT), the highest number of new riders (more than three times as many as BRT), and will result in a higher percentage of people using transit. This conclusion is not supported by the EIS and appears to be based upon biased assumptions about system design and performance. As defined by the EIS, the BRT alternatives offer fewer stations, less desirable routings, lower capacity stations and vehicles, and very little dedicated rights of way. Comparison of Metrorail and BRT Alternatives Considered Number of stations: Metrorail: 10-13 stations per alternative, depending upon the alignment; BRT: 1-5 stations per alternative (plus a few low capacity "stops"). Station location: Metrorail: Multiple stations in the heart of Tyson's corner, providing convenient access to significant office, retail, and residential land uses; BRT: No stations or stops in the heart of Tyson's corner, preventing convenient access to significant office, retail, and residential land uses. Station capacity: Metrorail: High capacity stations that are 600 feet long, capable of handling eight-car trains of 120 persons per car; BRT: In all but one option, lower capacity stations that are 260 feet long, capable of handling four buses of 61 persons each. Vehicle capacity: Metrorail: Roughly 120 passengers per rail car; BRT: Roughly 61 passengers per vehicle, even though existing BRT systems use vehicles that can carry 165 passengers and even 270 passengers per vehicle. Operational Frequency: Metrorail: Frequent operations of six-minute intervals during peak hours and 12-minute intervals during non-peak hours; BRT: Less frequent operations, with up to 24 minute intervals during both peak and non-peak hours. Right-of-way: Metrorail: Dedicated rights-of-way for the entire system, including elevated, at-grade, and underground tracks and stations; BRT: Virtually no dedicated rights-of-way, requiring operations almost exclusively in general traffic. Technology Investments: Metrorail: Significant built-in technologies to enhance performance, such as a control center and passenger information systems; BRT: No built-in technologies that could enhance performance, such as signal prioritization, queue jumping, and vehicle tracking. (0445, 0445-E –3)

Public Comment: Clearly, the BRT alternative was designed to provide a lower level of service than the Metrorail alternative. It is not surprising, therefore, that the EIS concludes that Metrorail will attract more riders. The lack of any fair way to compare the two alternatives is a significant flaw that must be resolved. Otherwise, the region may falsely conclude that Metrorail is the best alternative, and thus may spend billions of dollars on a system that is unnecessary and unwarranted. (0445, 0445-E –4)

Public Comment: Environmental Defense strongly supports transit in the Dulles Corridor. Transit will help build more livable communities, provide better access to jobs and cultural opportunities, reduce traffic congestion, and improve air quality. We are concerned, however, that inadequate consideration is being given to Bus Rapid Transit (BRT), a transit option that can have all the benefits of Metrorail but at a fraction of the cost. Specifically, the current draft Environmental Impact Statement (EIS) needs to be revised to include BRT options that parallel the existing Metrorail options, enabling a fair comparison of the two modes. (0444, 0444-E –1)

Public Comment: The EIS also runs counter to evidence suggesting that BRT can match if not exceed the ridership of comparable rail systems. For example, the United States General Accounting Office compared BRT to light rail projects in a number of cities and concluded that BRT and light rail ridership generally is "quite similar." Another study concluded that "the evidence suggests that one can move three times as many people by dedicated bus-based transitway systems for the same cost [as comparable rail systems]." Similarly, a book recently published by the International Energy Agency concludes that BRT can "make all cities more efficient, cleaner, less gridlocked and more sustainable" and that BRT "opens a new era in low-cost, high-quality transit." The EIS must provide a credible analysis before reaching broad conclusions about ridership. (0445, 0445-E –5)

Public Comment: There are a couple of potential ways to begin addressing the blatant bias in the draft EIS. First, the alternatives could be redrafted so that the Metrorail alternatives are compared with BRT alternatives providing a similar number of stations and similar routing. At a minimum, this would require significant BRT stations in Tyson's Corner as well as the construction of separate rights-of-way for at least part of the BRT system. It also would require the examination of alternatives that provide BRT service to stations other than West Falls Church, such as Rosslyn. This will provide a more accurate assessment of BRT capabilities and potential benefits. (0445, 0445-E –6)

Public Comment: Metrorail service would provide a much greater increase in the capacity to move people through the corridor than either BRT or Combined BRT/Metrorail. As mentioned above, the BRT alternative, as defined in the EIS, is unduly limited in its ability to move people through the corridor. There are not enough stations or stops in the right places, the service is too infrequent, and the station and vehicle capacities are not designed to compete with the capacity of Metrorail. As a result, it is impossible to conclude that Metrorail will provide a much greater capacity increase than Metrorail. (0445, 0445-E –8)

Public Comment: Existing BRT systems clearly demonstrate that BRT can meet or exceed the ridership projected in the EIS. The EIS estimates that the new Orange Line extension would have the capacity to carry roughly 10,000 riders per peak hour in the morning. However, the BRT system in Bogota, Columbia carries more than 40,000 passengers per hour on its main line, roughly four times the number proposed for the Metrorail extension. Similarly, the BRT system in Curitiba, Brazil, carries more than 23,000 passengers per peak hour on one of its lines. A recent study by the Reason Public Policy Institute noted that "with few exceptions[,] some form of express bus system, operating on either an exclusive right of way or shared facility, would have lower costs and higher performance than either light or heavy rail systems in nearly all, if not all U.S. cities." A better analysis must be conducted of the potential capacity increases available with BRT. (0445, 0445-E –9)

Public Comment: Conclusion #3: Metrorail service generally results in the shortest travel time, especially for reverse commute trips and those that begin and end in Tysons Corner. Once again, this conclusion is based upon the extremely biased and limited definition of BRT contained in the EIS. Shortest Travel Time: Even with the limited definition of BRT, the travel times for Metrorail cited in the EIS are not much better than BRT. For example, Table 6.3-4 shows that travel times in selected origin/destination pairs are very similar for BRT and Metrorail, despite the distinct disadvantage placed upon BRT by the EIS. It is reasonable to assume, therefore, that if the BRT alternatives are revised to offer a fair comparison to Metrorail, the BRT alternative may actually provide faster travel times than Metrorail. This result would be consistent with the GAO study, which found that BRT speeds were faster than light rail in five out of six cities analyzed. (0445, 0445-E –12)

Public Comment: Shortest Travel Times for Trips Within Tyson's Corner: This conclusion is simply not credible. None of the BRT alternatives contain stations or stops within the heart of Tyson's Corner. By contrast, each of the Metrorail alternatives contain multiple stations within the heart of Tysons, with alignment T4 containing six stations within Tyson's Corner. Obviously, given such a biased set of alternatives, Metrorail will provide shorter travel times within Tyson's. The BRT alternatives must be revised to provide comparable station locations and infrastructure within Tyson's, so that a fair comparison can be made. (0445, 0445-E –14)

Public Comment: Conclusion #5: More members of the business community, area neighborhood residents, and civic organizations have expressed support for Metrorail than for any other choice. It is not surprising that more people and groups have expressed support for Metrorail than other options, because no other viable options have been presented. The median of the Dulles access road has been reserved for rail since the 1960's. When serious discussions began about the Dulles corridor, there was an assumption that the extension would be Metrorail. Not surprisingly, the 1997 Major Investment Study (MIS) recommended rail. After significant pressure, however, the MIS was supplemented in 1999 to include consideration of BRT. However, as reflected in the EIS, BRT is not being treated as a serious alternative, and there is no real effort to educate the public about the potential benefits of BRT. The EIS must be revised to compare the Metrorail alternatives with comparable BRT alternatives. Moreover, a

public education campaign must be conducted to help reverse some of the significant bias toward Metrorail. Without such a campaign, the public cannot make an informed choice and a Metrorail alternative will be effectively forced upon them. (0445, 0445-E –17)

Public Comment: Conclusion #8: BRT would provide less overall passenger capacity than Metrorail. There simply is no credible information available to support this conclusion. For example, as discussed above: the Metrorail alternatives in the EIS have nearly three times as many stations as the BRT alternatives; the Metrorail stations are significantly larger than the BRT stations, capable of handling 960 passengers per train (8 cars with 120 passengers each) versus 244 passengers (4 BRT vehicles with 61 passengers each, even though vehicles are capable of carrying 2-3 times as many passengers); ·BRT systems in other countries routinely carry several times as many passengers as the proposed Orange Line extension, at a fraction of the cost; the Metrorail alignments go through the heart of Tyson's, whereas the BRT alignments bypass the heart of Tysons; and the Metrorail trains would run at 6-12 minute intervals, whereas the BRT would run at up to 24 minute intervals, even during peak hours. (0445, 0445-E –20)

Response: *Because these comments were related, a combined response was prepared. The response is divided into several subparts.*

Comparison of Comparable Alternatives The Draft EIS was not intended to present a comparison of nearly identical alternatives. It was intended to evaluate the relative merits and impacts of a reasonable number of alternatives that have been determined to meet project area transportation needs. Because the selection of a locally preferred alternative typically depends on an evaluation that focuses on the key differences and possible trade-offs between alternatives, alternatives that differ allow decision makers to better understand the benefits and costs of alternate approaches to providing improvements.

For example, while one alternative might be particularly effective in meeting the transportation and land use goals of the area, the benefits it provides may be small when compared to the costs. At the same time, a different alternative might be more cost-effective, but may not meet project goals and objectives as well as another alternative. Officials would have to make a trade-off between the two alternatives, deciding which criteria have priority. In another example, the relative importance of land use impacts and transportation service improvements may need to be decided if one alternative greatly improves transportation service but has highly negative land use impacts, while another alternative has fewer land use impacts but does not provide as much improvement in transportation service.

Ultimately, the trade-offs identified for different alternatives may lead decision makers to select a preferred alternative that combines beneficial elements of each.

The Definition of BRT in the Dulles Corridor The BRT Alternative defined in the Draft EIS was an appropriate definition of BRT for the Dulles Corridor, given its conditions and constraints in the corridor. Though BRT applications in other cities have different route structures and capacities, the evaluation of a particular mode in a given corridor is dependent on a number of factors. In other cities, the same limitations on space and lane availability may not apply. Therefore, the performance and capacities of these applications do not necessarily have relevance for the Dulles Corridor Rapid Transit Project.

As described in Chapter 2 of the Draft EIS, BRT is an emerging transit mode in which buses are used to provide high-quality service akin to a rapid rail system. It was intended to provide rail-like service and amenities at a lower cost. Therefore, in the context of the Dulles Corridor, the BRT Alternative was developed to serve the same type of travel needs as the proposed Metrorail Alternative. The intent was to evaluate a lower-cost, lower-impact alternative to see if it could have provided the same level of benefit as a Metrorail Alternative.

Both BRT and Metrorail were designed to primarily serve the east-west travel demand between existing and emerging activity centers along the Dulles Toll Road, and between these centers and the region's core. As described in Chapter 2, both were intended to function as an extension of the existing Metrorail system, taking advantage of the direct connection this system already provides to Arlington and the region's core. In the context of the Dulles Corridor Rapid Transit Project, BRT was meant to be a complement to the existing regional rapid transit system, not a competing regional system. Therefore, BRT routes that provided direct connections between the Dulles Corridor and Arlington, Washington, D.C., or Maryland rather than connect to the existing Metrorail system at the eastern end of the corridor would not be appropriate in the Dulles Corridor. Moreover, given that BRT vehicles would likely have to travel on congested roadways to reach these regional destinations, it is doubtful they would offer faster travel times than the existing Metrorail system, which operates on an exclusive guideway.

As a result, the proposed alternatives would not serve the travel needs of all trip makers in the Dulles Corridor. They would, however—in combination with the planned transit-oriented urban form—help to increase overall mobility in the corridor. Highway and transit improvements that address other travel needs are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans. Overall, this program of improvements is intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.

The BRT Alternative made use of the relatively exclusive travel way in the DIAAH to provide rapid, limited-stop service for long-distance trips between the corridor and the region's core. The alternative was also attractive for short-distance trips between activity centers within the corridor, because it offered time-savings over existing corridor transit services for these trips. However, most trips on the proposed alternative were expected to be at least 20 to 30 minutes in length.

An efficient way to serve both the long-distance and short-distance trips in the Dulles Corridor would be to have stations in the median of the DIAAH. These stations would eliminate the need for buses to enter and exit the freeway on local streets, reducing overall travel times, even though many operating patterns make multiple stops along the corridor. This station configuration and the proposed operating patterns also would allow the alternative to efficiently provide access for travelers heading to and from multiple, dispersed origins and destinations.

Some commenters have suggested that because BRT is more flexible than a rail system, its operating pattern should be based on multiple "point-to-point" express services. However, it would be very difficult to provide a cost-effective service for the Dulles Corridor using several, dedicated express routes due to the relatively dispersed land use patterns. For a point-to-point transit service to be as efficient as possible, it must be able to attract a large number of travelers within a relatively small area at the origin end that all want to go to the same destination (or multiple destinations within a small area). Travel time at the "circulation and distribution" end of the trip should not be more than 10 minutes, or the increased travel times make the dedicated service a less attractive travel alternative.

Most travelers in the Dulles Corridor are coming from dispersed, lower-density locations throughout the region, and traveling to dispersed destinations throughout the corridor and the region (some high-density, some not). While travel within the corridor and between the corridor and the region is significant, travel from each dispersed location is, in general, not significant enough to support a dedicated, point-to-point type of service. Therefore, it would not be efficient or feasible to provide rapid transit improvements in the Dulles Corridor primarily using a series of "one-seat ride" express services with circulation/distribution at either end.

On the other hand, the Metrorail and BRT Alternatives of the Draft EIS used several stations to concentrate multiple origins or destinations at a discrete location. Park-and-ride facilities and feeder bus services are able to attract travelers from dispersed origins, and then the multiple stations along the transit line are able to distribute passengers to multiple destinations. In this

way, these alternatives could have efficiently provided access for many travelers heading to and from multiple origins and destinations.

The proposed BRT 3 alignment option used a slightly different operating pattern that includes stops at park-and-ride lots rather than median stations, and more point-to-point express services. This option more closely approximated the "simpler" BRT service suggested by many commenters; the option also had the lowest ridership of the proposed Build Alternatives.

To the extent possible, the BRT and Metrorail alternatives were designed to be similar. However, due to several constraints, it was not possible for BRT to provide the same person-moving capacity through the corridor or to provide the same level of service to Tysons Corner.

Space considerations at West Falls Church limited the ability to increase the number of BRT bus bays at this station to support more than the proposed 80 vehicles per hour in the peak period. Moreover, at this flow rate, vehicles would have arrived at West Falls Church every 45 seconds, on average. More frequent arrivals would have likely resulted in delays as buses are forced to wait for an open bay until buses in front of them pull out.

In Tysons Corner, providing the same level of service as Metrorail with BRT would have reduced the cost and timing advantages associated with the BRT Alternative. Operating the BRT service on congested roadways in Tysons Corner to provide more direct connections to destinations would have increased travel times and offered little benefit over driving. Such a system would not have bees an attractive travel alternative, and would not have likely attracted high ridership. However, Fairfax County and VDOT would have been unlikely to dedicate a lane for exclusive bus use, given that many roadways in Tysons Corner were expected to operate at or above capacity in the future, even after implementing capacity increases (see Chapter 6 in the Final EIS).

Therefore, the only way to provide the same level of service and directness would have been to operate BRT on a grade-separated route through Tysons Corner. Both an elevated route and an underground route would have added considerable expense and construction time to the project, thereby diminishing two of the primary advantages of BRT in the Dulles Corridor. An elevated roadway would also have had the same degree of visual impacts as an elevated Metrorail alignment. Because a grade-separated alignment for BRT through Tysons Corner would increase the cost, construction time, and impacts of the alternative, this was not considered an advantageous configuration for the BRT Alternative, especially given that it would still have required a transfer at West Falls Church, reducing overall ridership as compared to the Metrorail Alternative.

Travel Time Comparisons. The analysis presented in Chapters 6 and 10 of the Draft EIS confirmed that both the BRT and Metrorail alternatives offered similar travel times for many of the analyzed origin-destination pairs. In many of these cases, travel times were competitive with those for automobile travel. For trips within the corridor, Metrorail was and is the most time competitive with automobiles. However, for some of the trips traveling between the corridor and other regional locations, the analysis shows that BRT did offer slightly faster travel times.

Because the BRT operating plans included multiple route patterns, some of which only include stops at a few stations, some individual routes did experience higher average speeds than Metrorail. However, because the alternative could not have provided a direct connection to Tysons Corner and forced a transfer at West Falls Church, the BRT Alternative still had lower ridership overall.

The Draft EIS did not include any conclusions regarding the shortest travel times for trips within Tysons Corner. Rather, as discussed above, the analysis showed that Metrorail generally had the shortest travel times for trips with one end in Tysons Corner.

Public Education. Every public outreach activity conducted as part of the public involvement program, which was outlined in Chapter 11 of the Draft EIS, provided information to the public about bus rapid transit and its unique features. The efficiencies afforded by the BRT Alternative have been shown in the numerous project materials that provide comparative data about the alternatives under consideration. It would be inappropriate to promote one mode under consideration over other modes through the public involvement program.

Ridership. The ridership estimates presented in Tables 6.3-8 and 10.1-5 of the Draft EIS support the statement that Metrorail will deliver the highest ridership (more than twice as much as BRT), the highest number of new riders (more than three times as many as BRT), and would result in a higher percentage of people using transit. Information on how the travel demand models work, the assumptions employed by the Project Team, and the model results can be found in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

The General Accounting Office study referenced by the commenter seems to address the relative benefits of regional rapid transit systems that are bus-based versus regional systems that are rail-based. It is not clear from this comment whether the study addressed the relative benefits of the different modes when expanding an existing system. As noted earlier, the BRT Alternative for the Dulles Corridor was intended to function as an extension of the existing regional rail system. It was not intended to serve as a competing regional rapid transit system.

Vehicle Capacity, As the commenter notes, some BRT vehicles are capable of carrying much higher passenger loads than the vehicles proposed for the Dulles Corridor Rapid Transit Project. The BRT system in Bogotá, Colombia, uses 60-foot articulated buses that accommodate approximately 160 passengers (approximately 43 seated and 114 standing). This standee load is based on an area of 4 persons per square meter, or 2.7 square feet per person—a standard that most riders would find very uncomfortable (at this density contact with other persons is unavoidable). In Curitiba, Brazil the BRT system uses an 80-foot bi-articulated vehicle with a capacity of 270 persons, but again, the bus has approximately 57 seats, so most of these passengers are standees.

Loading vehicles to these capacities would not be appropriate or safe in the Dulles Corridor. The Transportation Research Board's Transit Capacity and Quality of Service Manual (1999) notes that, "High-speed bus service on busways and HOV lanes should not allow standees, so capacity calculations should assume that every passenger may be seated" (Page 2-41). In addition, a high reliance on standees is characteristic of a system with short trip lengths—such as Transmilenio, not Dulles. Within the Dulles Corridor, many trips are projected to cover at least two-thirds of the length of the corridor (20 to 30 minutes). Standing for this length of time on a bus would be unacceptable to many travelers. Moreover, because BRT does not have the same quality of ride as Metrorail, loading passengers to a "crush" level would not be tolerated by most patrons.

Station Capacity vs. System Capacity. As described in Chapter 6 of the Draft EIS, transit capacity in the corridor represents the amount of physical space available to carry passengers and provides an understanding of the number of riders that can be comfortably accommodated in the corridor during peak travel times. Total capacity will vary according to the number of vehicles in service and the capacity of each of those vehicles. These calculations are not dependent on the number of stations for each alternative or the size of these stations.

Station size was generally determined based on the peak vehicle requirements generated by projected demand. As outlined in Section 2.3 of the Draft EIS, various BRT platform lengths and station configurations were evaluated in the Draft EIS. Under the BRT 1 alignment option, most stations would have had the same 600-foot platforms as the Metrorail Alternative. BRT 2 would have had 260-foot platforms. The Draft EIS Facilities General Plans (Volume IV), sheets 733 through 738 showed these two configuration options for the Wiehle Avenue Station.

As described in Chapter 2 of the Draft EIS, the operating plan for BRT would have resulted in approximately 80 BRT vehicles serving the eastern end of the corridor in the peak hour in the peak direction. With approximately 61 seats per vehicle, the peak-hour capacity provided by the BRT Alternative would have been 4,880 passengers. The Metrorail operating plan would result in 10 trains traversing the corridor in the peak hour in the peak direction. With 8 cars per train and a loading goal of 120 passengers per car per hour, the Metrorail Alternative would provide capacity for 9,600 passengers during the peak hour. Therefore, Metrorail capacity in the Dulles Corridor would be approximately twice that of BRT.

As noted earlier, space considerations at West Falls Church limit the ability to increase capacity further by increasing the number of BRT vehicles operating in the corridor during the peak hour.

For different applications in other cities, where the same limitations on standees and the volume of buses do not apply, BRT systems can have much higher capacities. In some cases, BRT systems carry the same level of demand as rail systems (as noted by the commenter).

Frequency of Service. As described in Chapter 6 of the Draft EIS, the peak-period headways for the BRT alternative would have generally been 6 to 12 minutes. Some of the routes for BRT 2 and BRT 3 would have operated with 4-minute headways. Many of the high-demand BRT routes would have operated with 6-minute service frequencies using two-vehicle platoons. These two-vehicle platoons can be thought of as bus trains, where the two vehicles run in tandem, though not physically connected like rail cars. In the off-peak period, service would have operated at 12- to 24-minute frequencies. These service frequencies were comparable to Metrorail service frequencies. BRT routes that operated with 12-minute headways in the peak period and 24-minute headways during the off-peak period did so because more frequent service was not required to meet the low demand projected for these routes.

Dedicated Rights-of-Way As described in Chapter 2 of the Draft EIS, the BRT Alternative primarily operated on the relatively exclusive travel way along the DIAAH, and was permitted to use the eastbound shoulder of the Dulles Connector Road during periods of severe congestion, when such use did not present a safety hazard to general-purpose traffic. This would have been no different than bus operations on the shoulder today. Some BRT vehicles would also have used the HOV lanes of the Dulles Toll Road, in certain limited areas between Route 28 and Route 7.

As shown in Table 6.1-2 in the Draft EIS, the DIAAH operates at Level of Service (LOS) C during the peak period. This level of service represents moderately congested conditions and relatively free-flow travel speeds. By 2025, the DAAR is expected to operate at LOS D. This level of service represents more congested conditions, but speeds are only reduced moderately, and, in practice, it is widely considered an acceptable level of service.

Table 6.2-1 showed that, for the BRT Alternative in 2025, the DIAAH was projected to operate at LOS C—an improvement over the LOS D projected for the No-Build Alternative. Tables 6.1-2 and 6.2-1 also showed that the HOV lane on the Dulles Toll Road operates at LOS and is expected to continue operating at LOS C under all alternatives. Therefore, introducing BRT vehicles to the DIAAH and the HOV lane did not hinder traffic operations on the roadway, nor did the expected levels of roadway traffic hamper BRT operations.

As described earlier, it would not have been cost effective to provide an elevated guideway for BRT through the core of Tysons Corner. Such an alignment would also have had more severe visual impacts than the alternative proposed in the Draft EIS.

Other. Please note that BRT was advanced in the MIS Supplement as an interim step to rail, and was not envisioned as a stand-alone alternative or system. As summarized in Section 2.1.2 of the Draft EIS, DRPT had concluded that BRT was best suited as an interim transit solution in the

Dulles Corridor, which would have immediately started addressing transit needs and ultimately allow for implementation of rail in the corridor.

Because BRT operated in a relatively exclusive guideway with dedicated slip ramps to access median stations, it would not have required technology enhancements such as queue jumpers or signal prioritization to improve performance. WMATA has been incorporating ITS information capabilities, such as smart cards, next train arrival information, and escalator/elevator outage information, into the existing Metrorail system. Similar information technologies would be incorporated into the final design of the LPA.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Public Comment: Second, some attempt should be made to "normalize" the analysis by providing common measures upon which to compare all of the alternatives. There are established techniques, such as cost-per-new-rider and cost-per-revenue mile, that must be included in the EIS to make a fair comparison and rational determination. Such measures are likely to show that Metrorail is a less attractive alternative, because in addition to the high construction costs, most subway systems require operational subsidies in the range of 40 cents per passenger. By contrast, the best BRT systems are not only much cheaper to build, they actually make a profit on their operations, requiring no subsidies from the taxpayer. Lessons can be learned from these systems, and these lessons should be incorporated into the EIS analysis. (0445, 0445-E –7)

Public Comment: Also we believe that BRT is going to be much less expensive than the amount projected in the EIS because the EIS requires these special stations and so forth to be built, but if you just go with BRT, you don't need those. You can use a much simpler type of station, you have more stations. BRT systems typically have three to four times more stations and more consumer choice than the rail can provide. (0138, 0241-T –7)

Response: *As described in Chapter 2 of the Draft EIS, there were three different BRT alternatives representing different approaches to BRT station type and design. The cost estimates for each BRT alignment were presented in Chapters 2, 8, and 10 of the Draft EIS. The BRT 3 alignment option used stops at park-and-ride lots rather than median stations, with more point-to-point types of express service. Although it did not have more stations than other alignments, this option most closely approximated the "simpler" BRT suggested by the commenter; the option also had the lowest ridership of the proposed Build Alternatives.*

The BRT service proposed for the Dulles Corridor Rapid Transit Project was intended to serve the same type of travel needs as the proposed Metrorail service. In the Dulles Corridor, the BRT Alternative took advantage of the relatively exclusive right-of-way in the DIAAH to provide rapid, limited-stop service for long-distance trips between the corridor and the region's core. The alternative was also attractive for short-distance trips between activity centers within the corridor, because it offered time savings over existing corridor transit services for these trips. However, most trips on the proposed alternative were expected to be at least 20 to 30 minutes in length.

An efficient way to serve both these long-distance and short-distance trips was to have stations in the median of the DIAAH. These stations eliminated the need for buses to enter and exit the freeway, reducing overall travel times, even though many operating patterns make multiple stops along the corridor. This station configuration and the proposed operating patterns also allowed the alternative to efficiently provide access for travelers heading to and from multiple, dispersed origins and destinations.

Therefore, for the BRT Alternative proposed in the Draft EIS, it would not have been possible to have "simpler" stations. Median stations (which facilitate more rapid service) require pedestrian

bridges and associated vertical circulation, which includes both elevators and escalators. Dulles Corridor BRT costs also included structured parking at certain stations, new acceleration/deceleration ramps for station access along the DIAAH, and Metrorail vehicle costs for the increased ridership on the Orange Line that would result from the BRT Alternative.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Public Comment: In conclusion, my point is that we don't have a -- the EIS doesn't make a fair evaluation of the bus rapid transit, it doesn't make a fair evaluation of the metrorail alternatives, either, because of the problem of connectivity. (0255, 0255-T –7)

Response: *The Final EIS was approved by the Federal Transit Administration for distribution as a fair evaluation of the Build Alternatives under consideration. System connectivity was one of the components evaluated in the Final EIS.*

Public Comment: A review of the DEIS indicates there is a bias toward rail. To have an efficient rail system requires a significant increase in bus service. Therefore, in anticipation that rail is transit choice and that bus service to serve the rail is required, answers to the following questions are required: What will be the increase in bus ridership? What will be the bus unit costs (costs per mile or hour)? What will the cost to operate the required bus service to serve the rail transit needs? What agency will assume responsibility to provide the bus service? What will be the cost to each district? What will be the source of the funding to meet this cost according to each district? (0147, 0459-L –25)

Response*: As stated in Section 6.3.1 of the Draft EIS, operating plans for the No-Build Alternative and each Build Alternative were developed based on a comment set of assumptions. The operating plan for each Build Alternative reflected both rapid transit services operating within the corridor and complementary local and feeder bus service. Data on ridership increases just by bus were not calculated as part of the ridership estimation process for this project. However, new transit trips were outlined in Table 6.3-8. All BRT alignment options and Metrorail alignment options resulted in an increase in regional transit trips. Fairfax and Loudoun Counties contract their bus service to private operators. The per unit cost is simply the fee paid to the contractors. Bus operating unit costs for WMATA were calculated using WMATA's cost model. Operating costs for each alternative for each operator are shown in Chapter 11 of the Transit Operations and Maintenance Plan, (June 2002). Operating agencies responsible for bus service in the corridor would have remained responsible for operations. These agencies include Fairfax County, Loudoun County, and WMATA. Operating costs by district were not calculated since this was not required for project analysis. Funding and subsidy estimates for each jurisdiction in the corridor were shown in the Draft EIS Chapter 8. As noted, local and feeder bus plans were developed for the No-Build and each of the Build Alternatives. These bus plans reflected estimated demand as well as detailed input from the jurisdictions responsible for operating the bus systems. Operations and maintenance costs for each bus service were calculated and included as part for the overall operations and maintenance cost for the project and were included in Section 8.3 of the Draft EIS.*

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Costs per Rider

Public Comment: What will be the cost per new rider based on cost escalation or failure to reach ridership projections? (0147, 0459-L –30)

Public Comment: What will be cost annually per new rider? (0147, 0459-L –29)

> ***Response****: Using the methodology used by the Federal Transit Administration for New Starts projects, the total cost per new transit rider for the Wiehle Avenue Extension is estimated to be approximately $24.73 (in 2004 dollars). This is based on total annualized capital and operating costs divided by the number of new transit riders, which is estimated in the travel demand forecasting process.*

Public Comment: Over a 20 year career (rider using the rail), what is the gross spending per new rider under the ridership projections? (0147, 0459-L –31)

> ***Response****: The cost per new rider is a measure of cost effectiveness, and is not applicable to being assigned to a specific individual. Once the individual begins to use the transit system, he or she is no longer a new rider, and the incremental cost and ridership are adjusted.*

Public Comment: As projects proceed to implementation, costs often increase. What is the cost per new rider at beginning and at five year increments? (Cost per new rider is calculated using 450 annual trips which is multiplied by the operating and capital cost per new ride.) (0147, 0459-L –32)

> ***Response****: The cost per new rider is a Federal Transit Administration (FTA) cost-effectiveness measure that has specific input requirements. One input measure is that the number of new transit riders in the project's forecast year (2025). Calculation at 5-year intervals would require a new series of ridership estimates combined with the annualized capital and operating costs for the Build Alternatives at 5-year intervals. This is a significant amount of work that would produce results not greatly different from that published in Table 10.2-1 of the Final EIS.*

Concern of Metrorail Delays Not Being Incorporated Into Travel Demand Forecasts

Public Comment: The EIS also ignores the significant delays experienced on Metrorail as a result of mechanical malfunction and other problems. If a car or train on Metrorail experiences a problem, all other trains on the same track will be delayed. For example, just this month, a broken down train on the Red Line caused all Red Line traffic inbound from Shady Grove to come to a stop for twenty minutes, causing major delays for thousands of commuters. Earlier that same morning, a switch broke, requiring single-track operations and causing even more delays. On the other hand, BRT does not suffer from the same vulnerability. BRT vehicles are independent of each other – when one breaks down the entire system is not brought to a standstill. Even when operating in a dedicated right-of-way, a well-designed BRT system can avoid the types of delays that frequently are suffered by Metrorail riders. To properly assess travel times for both systems, the EIS must address the frequency of delays and their impact on the overall system. (0445, 0445-E –13)

> ***Response****: Travel demand forecast models are designed to evaluate travel patterns and volumes under "average" conditions for both the transit and highway system; therefore, "events" such as mechanical breakdowns are not factored into these analyses. Because these types of events are not regular occurrences, and their frequencies are difficult to predict, it would not be practical to include "breakdown" scenarios in travel demand forecasts. Additional information on how the travel demand models work, the assumptions employed by the Project Team, and the model results can be found in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).*
>
> *The commenter is correct in stating that a breakdown in the Metrorail system would have greater potential for a "ripple effect" on service throughout the system than a breakdown in a BRT system, because it is much easier to route operations around a malfunctioning bus than around a malfunctioning train. However, WMATA's Standard Operating Plan for Metrorail contains plans and procedures to maintain service and safety in emergency situations. This plan provides*

procedures to prevent collisions with other Metrorail cars and disruptions in operations along the line or at stations.

Note that even though a breakdown in the BRT system would have had less potential to affect overall system operations, because BRT in the Dulles Corridor would function as an extension of the existing Metrorail system, a breakdown or delay in the regional system would have affected BRT operations in the corridor to the same extent it would have affected Metrorail operations in the corridor.

Impacts on Reverse Commutes

Public Comment: Shortest Travel Times for Reverse Commutes: The EIS contains no analysis for this conclusion and is not clear regarding the definition of "reverse commute." Moreover, the EIS offers no alternatives to meaningfully analyze the impact on reverse commuters. All of the BRT alternatives connect with Metrorail at West Falls Church. BRT, however, can be configured to connect with many other Metrorail stations in Arlington, the District, or Maryland, most likely at a fraction of the cost of building a Metrorail extension through the Dulles Corridor. These alternatives could provide better travel times for reverse commuters than Metrorail and thus must be considered before a conclusion is reached that Metrorail is the preferred option for reverse commuters. (0445, 0445-E –15)

***Response**: A "reverse commute" is generally understood as a trip from home to work that is in the opposite direction of most commuters. Someone who lives in Washington, D.C. but works in Reston would have a reverse commute, because most people travel from the suburbs to downtown for work. This definition was implied in Chapter 10 of the Draft EIS.*

Tables 6.3-4 and 10.1-4 in the Draft EIS showed forecast travel times for select origin-destination pairs. Because the direction of a trip can be understood by knowing its origin and destination, these tables demonstrate travel times for several reverse commute trips (Union Station to Reston Town Center, Tysons Corner to Dulles Airport). As indicated in the supporting text in Chapter 10, the Metrorail and Phased Implementation alternatives provided the shortest travel time by transit for the reverse commute trips shown.

All alternatives analyzed in the Draft EIS provided service in both the eastbound and westbound directions. Because the travel demand forecasting models used to determine patronage estimates produced estimates of all travel in the region, for all modes and all trip purposes, it was possible to tell from the results of the model the direction of travel and the volume of travel in each direction by all modes. The travel times shown in Tables 6.3-4 and 10.1-4 were one of the numerous model outputs that reflect directional travel and the potential benefits for reverse commuters. Additional information on how the models worked, the assumptions employed by the Project Team, and the model results can be found in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Both BRT and Metrorail were designed to primarily serve the east-west travel demand between existing and emerging activity centers along the Dulles Toll Road, and between these centers and the region's core. As described in Chapter 1, both were intended to function as an extension of the existing Metrorail system, taking advantage of the direct connection this system already provides to Arlington and the region's core. In the context of the Dulles Corridor Rapid Transit Project, BRT was meant to be a complement to the existing regional rapid transit system, not a competing regional system. Therefore, BRT routes that provide direct connections between the Dulles Corridor and Arlington, Washington, D.C., or Maryland rather than connect to the existing Metrorail system at the eastern end of the corridor would not be appropriate in the Dulles Corridor. Moreover, given that BRT vehicles would likely have to travel on congested roadways to reach these regional destinations, it was doubtful they would have offered faster travel times than the existing Metrorail system, which operates on an exclusive guideway.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Ability of BRT/Metrorail to Support Comprehensive Plan Goals

Public Comment: Conclusion #4: Metrorail would have higher growth potential in station areas along the corridor due to planned increases in allowable densities at rail stations, and better contributes to the objectives of adopted county master plans. There is no support for this conclusion. According to the EIS, BRT is consistent with the Loudoun and Fairfax County master plans. There is no indication that Metrorail "better contributes" to the objectives of these plans. In addition, there is no indication that Metrorail would create higher growth potential than BRT. One of the hallmarks of BRT is that the station can serve as an attractive and vital link to the community, providing a focal point for investment and transit-oriented development. A BRT station can have all of the attributes of a rail station: advance fare collection, level-boarding platforms, passenger information systems, and ample parking. It also can be high-capacity, providing the passenger throughput necessary to support high density zoning. As mentioned above, however, the BRT stations in the EIS are relatively small and are not designed for the same capacity as Metro stations. (0445, 0445-E –16)

Public Comment: Conclusion #7: BRT does not support land development patterns in Tyson's Corner as well as Metrorail, Combined BRT/Metrorail, or Phased Implementation, and cannot penetrate Tysons Corner to effectively serve its workers, shoppers, and residents. There is no credible information to conclude that BRT cannot support land development patterns in Tyson's. First, all of the BRT alternatives bypass the heart of Tyson's corner, thus making it impossible to assess BRT impact on land development patterns. Second, as mentioned above, the EIS itself concedes that BRT is consistent with the Fairfax and Loudoun Country master plans. BRT stations can be every bit as permanent and attractive to transit-oriented development as Metrorail stations. New alternatives must be developed and analyzed before concluding that Metrorail will better support land-use patterns. (0445, 0445-E –19)

***Response**: Chapters 3, 5, 9, and 10 of the Draft EIS presented information on land use effects and the planned development densities at rapid transit stations in the Dulles Corridor. The conclusions cited above were based on the information presented in these chapters. As indicated below, BRT was consistent with county plans, but did not support the plans as well as Metrorail because density bonuses in Tysons Corner only apply to rapid rail stations.*

Alignment BRT 1 would be consistent with adopted comprehensive plans. However, construction of only Alignment BRT 1, without any Metrorail service through Tysons Corner, would not achieve several of the goals for Tysons Corner, including the creation of transit-oriented development that is allowed only with the construction of rapid rail through the core of Tysons Corner." Similar statements were made in each of the other chapters referenced above.

In Tysons Corner, providing the same level of service as Metrorail with BRT would reduced the cost and timing advantages associated with the BRT Alternative. Operating the BRT service on congested roadways in Tysons Corner to provide more direct connections to destinations would have increased travel times and offered little benefit over driving. Such a system would not have been an attractive travel alternative, and would not have likely attracted high ridership. However, Fairfax County and VDOT would have been unlikely to dedicate a lane for exclusive bus use, given that many roadways in Tysons Corner are expected to operate at or above capacity in the future, even after implementing capacity increases (see Chapter 6 in the Final EIS).

Therefore, the only way to provide the same level of service and directness would have been to operate BRT on a grade-separated route through Tysons Corner. Both an elevated route and an underground route would have added considerable expense and construction time to the project, thereby diminishing two of the primary advantages of BRT in the Dulles Corridor. An elevated roadway would also have had the same degree of visual impacts as an elevated Metrorail

alignment. Because a grade-separated alignment for BRT through Tysons Corner would have increased the cost, construction time, and impacts of the alternative, this was not considered an advantageous configuration for the BRT Alternative, especially given that it would still have required a transfer at West Falls Church, reducing overall ridership as compared to the Metrorail Alternative.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Need to Leverage Prior Transportation Investments in the Corridor

Public Comment: Conclusion #6: Metrorail would provide the best opportunity to capture previous investment made in regional infrastructure. This conclusion is not supported in the EIS. Among other things, the EIS does not adequately address BRT's ability to leverage prior investments in both the region's roads and in Metrorail. Without such an analysis, it is impossible to reach the conclusion set forth in the EIS. For example, a BRT vehicle carrying sixty or more passengers is a far better use of roadway assets than sixty or more cars carrying one passenger each. Moreover, technologies such as signal prioritization actually increase the speed of all traffic, not just the BRT vehicle, because cars can move through the signals with the BRT vehicle. Similarly, even under the flawed BRT alignments contained in the EIS, BRT will transport a significant number of passengers to the Orange Line at nearly one-tenth the cost of the Metrorail extension. This will provide Metrorail with significant revenue opportunities at relatively little cost, thus leveraging previous investments in Metrorail. Other potential BRT alignments, not considered in the EIS, could transport passengers to other Metrorail lines, such as the Yellow and Blue lines. More analysis is required before a conclusion is warranted regarding which mode will best recapture prior investments in regional infrastructure. (0445, 0445-E –18)

Response: *The BRT Alternative was developed to provide high-quality service akin to a rapid rail system. It was intended to provide rail-like service and amenities at a lower cost. The intent was to evaluate a lower-cost, lower-impact alternative to see if it could have provided the same level of benefit as a Metrorail Alternative.*

Every effort was made to leverage prior transportation investments in the Corridor. The BRT Alternative made use of the relatively exclusive travel way in the DIAAH to provide rapid, limited-stop service for long-distance trips between the corridor and the region's core. However, operating the BRT service on congested roadways, particularly in Tysons Corner, to provide lower cost transit solutions would have increased travel times and offer little benefit over driving. Such a system would not have bees an attractive travel alternative, and would not likely have attracted high ridership. In addition, Fairfax County and VDOT would have been unlikely to dedicate a lane for exclusive bus use, given that many roadways are expected to operate at or above capacity in the future.

Therefore, BRT would need to operate on a grade-separated route through Tysons Corner. Both an elevated route and an underground route would have added considerable expense and construction time to the project, thereby diminishing two of the primary advantages of BRT in the Dulles Corridor. Because a grade-separated alignment for BRT through Tysons Corner would have increased the cost, construction time, and impacts of the alternative, this was not considered an advantageous configuration for the BRT Alternative, especially given that it would still have required a transfer at West Falls Church, reducing overall ridership as compared to the Metrorail Alternative.

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Need to Provide Comparable Level of Accessibility for Minority and Low-Income Populations

Public Comment: Conclusion #9: BRT does not provide the same level of accessibility for minority and low-income populations to regional job choices that include Metrorail. This conclusion does not make sense and is not supported by the EIS. BRT, unlike Metrorail, has the ability to travel on arterial streets and into neighborhoods. Thus, BRT alignments could be designed to pick up low income and minority customers and feed them into the Metrorail system. This would provide greater access for minority and low income customers than Metrorail alone. Moreover, it could reduce the need for many of these customers to purchase vehicles to transport themselves to a Metrorail station, thus reducing congestion and helping low income people reduce transportation expenses. Much more research and analysis must be conducted before the above conclusion can be reached. (0445, 0445-E –21)

> ***Response****: The information presented in Sections 3.8 and 10.1.5 of the Draft EIS demonstrated that low-income and minority populations near the proposed Route 28 Station would not have been served by the BRT 2 and BRT 3 alignment options, because these options did not include a station or stop at this location. In addition, because the BRT Alternative (all alignment options) would not have included the Tysons East Station, it would not have provided the same level of access for a concentration of minority residents along the south side of the Dulles Connector Road near the Route 123 interchange at the eastern edge of Tysons Corner.*
>
> *Overall, all Build Alternatives would have provided improved accessibility between jobs in the corridor and low-income and minority populations throughout the region by providing a direct rapid transit connection to the regional Metrorail system. However, the BRT Alternative did not provide the same level of access for minority populations in Tysons Corner as the other alternatives. BRT 2 and 3 did not provide the same level of access for minority populations in the vicinity of Route 28 as other alternatives.*
>
> *The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Need for Clarification on Measures of Effectiveness

Public Comment: I found that the use of different measures in the various tables and statistics made developing a baseline virtually impossible; e.g., passenger miles vs. passenger trips, years presented in varying increments, etc. Recommendation: Review the document and define the data in common terms. (0427, 0427-E –1)

> ***Response****: Chapter 10 of the Draft EIS presented the evaluation of alternatives relative to numerous measures, which were based on the project goals and objectives. For major transportation investments, an evaluation plan that relies exclusively on weighting schemes or cost analysis comparisons can be too rigid, making it difficult to compare attributes that are more qualitative or difficult to assign a cost value. Rather, an evaluation that clearly outlines performance relative to a project goals, and summarizes the essential differences between alternatives or the various trade-offs involved in selecting one over the other, is a more instructive and useful tool for decision makers.*
>
> *The analysis presented in Chapter 10 reflected not only the cost effectiveness of each alternative, but also each alternative's effectiveness in meeting more qualitative or non-monetary project goals, such as "supports future development," "supports environmental quality," and "serves low-income and minority populations." The final summary of the relative benefits and impacts of each alternative were outlined in Table 10.2-1. Table 2.7-4 presented the anticipated costs, impacts, and benefits of all alternatives then under consideration for the Dulles Corridor Rapid Transit Project, including the No-Build Alternative.*

The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Concern of Travel Demand Forecasts Used in Considering Alternatives

Public Comment: Please reconsider the evaluation of alternatives set forth in the draft EIS to increase the forecast ridership for alignment T4. (0084, 0458-E –5)

Public Comment: Reduce your estimate of the visual and aesthetic impact on the residential community along Westpark [from T4]. (0084, 0458-E –6)

Public Comment: Please reconsider the evaluation of alternatives set forth in the draft EIS to increase the forecast ridership for alignment T4 and to reduce your estimate of the visual and aesthetic impact on the residential community along Westpark. (0084, 0084-L –7)

***Response**: The demand forecasting model used to estimate ridership for each of the Metrorail alignments in the Draft EIS took into account a number of factors including overall trip time (including access to the station), station proximity to key employment concentrations, station proximity to residential concentrations, and ease of station access for pedestrians, autos, buses, and other modes. The same model algorithms and procedures were applied to each alternative in order to ensure consistent results. It should be noted that transfers do carry a penalty in calculating trip times. This was because surveys have shown that riders perceive wait times for transfers to be longer than the wait times actually are. Because of this people avoid transfers and will often not make a trip by transit if a transfer is required. This transfer penalty is reflected in the lower ridership numbers associated with Alignment T4. As an example, anybody wishing to go east who boards at Tysons Central A or Tysons Central B under Alignment T4 would first have had to go west to the Tysons West station, where they would then have had to transfer to a westbound train. This added time to the overall trip and included the transfer penalty as well. The same held true for eastbound passengers who wished to go to Tysons Central A or Tysons Central B. Finally anybody making a trip to Tysons from the east and wishing to get to Tysons Central C or Tysons Central D (the commercial core of Tysons) would have had to stay on the train through Tysons and then transfer at Tysons West for an eastbound trip.*

A more detailed description of the demand-forecasting model is available in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Assessment of visual and aesthetic impacts is more qualitative than patronage estimates. As outlined in Section 3.4 of the Final EIS, the Federal Highway Administration visual assessment methodology was used in assessing visual impacts. The assessment of significant impact from Alignment T4 was due to the relatively high aerial structures, and the large aerial station structures that would be built in proximity to residences.

Public Comment: Some have advocated measuring the success of an alternative by the number of people who use the system in a given year, such as 2025. I think this is a flawed measure of success because the rail system would result in raising tolls on the Toll Road to finance it, and this would naturally divert people off of the highway and onto the alternative. (0286, 0286-T –3)

***Response:** As described in Chapter 10 of the Draft EIS, the cost effectiveness for the alternatives in the Dulles Corridor Rapid Transit Project was measured using the then Federal Transit Administration's uniform method for analyzing costs and benefits. This method reflected the relative benefits of the proposed improvements, in terms of the number of riders attracted to the system, as compared to the costs to construct and operate the improvements.*

The travel demand models used to estimate patronage and the anticipated traffic volumes on area roadways accounted for all costs associated with a particular travel choice, including tolls, fares, parking costs, and the perceived "costs" of travel time. The output of the models reflected the choices travelers would be likely to make based on knowledge of travel times, costs, and other socioeconomic factors. In the Draft EIS, the model did not assume the toll increases proposed in the financing plan; rather it applied the current toll structure and expiration date (toll varies from $0.50 to $0.85 in each direction; tolls expire in 2016). The ridership estimates used to determine the cost effectiveness of the Build Alternatives did not reflect the effect of potential toll increases, because increasing the tolls was one of the many options under consideration for financing the project. Since increases in the tolls have been determined to be an appropriate way to fund the LPA, the effects of raising the tolls have been included in the Final EIS. Additional information on how the models worked and the assumptions employed by the Project Team can be found in the Travel Demand Forecasting Methodology and Results Report (June 2002).

Note that the toll increases proposed in the capital funding plan of the Draft EIS would result in tolls that are lower than the proposed transit fares for most trips on the proposed rapid transit alternatives. As outlined in Chapter 8 of the Draft EIS, the proposed toll increases would have resulted in a maximum toll of approximately $2.35 on the Dulles Toll Road in 2015. It is assumed in the Draft EIS that the Dulles Corridor transit line would use the same fare structure as the existing Metrorail system and that this fare would be adjusted for inflation over time. The maximum fare on the Metrorail system is $3.25 at the time of the Draft EIS. For trips between most parts of the corridor and Arlington and the core, the maximum fare would apply. In addition, parking fees would apply at rapid transit stations. Since the Metrorail has been selected as the Locally Preferred Alternative, and the ultimate funding plan includes extending or increasing the tolls, then the transit ridership projections and cost effectiveness measures in the Final EIS have been updated to reflect the effect the toll increases have on transit ridership.

Overall, the analysis presented in Chapter 10 of the Draft EIS reflected not only the cost effectiveness of each alternative, but also each alternative's effectiveness in meeting more qualitative or non-monetary project goals, such as "supports future development" and "serves low-income and minority populations." The final summary of the relative benefits and impacts of each alternative were outlined in Table 10.2-1.

Mode Capacity

Public Comment: The EIS also ignores the significant difficulties experienced by Metrorail in obtaining new rail cars. Without an adequate supply of reliable and reasonably priced cars, it is difficult to imagine how Metrorail will continue meeting demand. More alternatives must be developed, and additional analysis must be conducted, before a fair conclusion can be reached regarding whether Metrorail is more likely to provide greater future capacity than BRT. (0445, 0445-E –11)

***Response**: In preparing the Final EIS , the Project Team developed and evaluated the No-Build Alternative with the assumption that WMATA would be funding and implementing eight-car train operations to satisfy forecast demand prior to the Project. WMATA has been emphasizing to the Commonwealth of Virginia and to the Project's other funding partners the critical importance of the implementation of eight-car train operations. Under its Metro Matters campaign (see www.wmata.com/about/metro-mattersfactsheet.pdf), WMATA is presently seeking the absolute minimum funding of its near-term capital needs to sustain the Metrorail and Metrobus systems. Within the $3.3 billion Metro Matters campaign, there is over $600 million for the eight-car train operations.*

As outlined in Chapter 2 of the Draft EIS, the operating plan for BRT would have resulted in approximately 80 BRT vehicles serving the eastern end of the corridor in the peak hour in the peak direction. With approximately 61 seats per vehicle, the peak-hour capacity provided by the BRT Alternative would have been 4,880 passengers. The Metrorail operating plan would have resulted in 9 trains traversing the corridor in the peak hour in the peak direction. With 8 cars per

train and a loading goal of 120 passengers per car per hour, the Metrorail Alternative would provide capacity for 8,640 passengers during the peak hour. Therefore, Metrorail capacity in the Dulles Corridor would be approximately twice that of BRT.

Public Comment: The rail alternative is projected to carry 9600 passengers per hour, compared with 2370 for bus rapid transit. Rail, with the ability to carry 50 to 60,000 passengers per hour, has the capacity over the long term to serve the growing trip demands in the corridor. (0131, 0131-T –7)

Response: *The commenter's first statement reflects data shown in Table 10.1-3 of the Draft EIS. This table presents the capacity provided by each alternative at the Wiehle Avenue Station, not projected passenger demand.*

Although the capacity provided by Metrorail at the Wiehle Avenue Station reflects the capacity provided through the whole corridor (9,600 passenger per hour), this was not true for the BRT Alternative. Because not all of the "routes" proposed in the BRT operating plan included a stop at Wiehle Avenue, the capacity shown for this station was lower than the capacity provided by the BRT Alternative throughout the corridor. Overall, the BRT Alternative provided for 80 buses in the peak hour in the peak direction. With a vehicle capacity of 61 passengers, this volume of service resulted in a capacity of 4,880 passengers per hour for BRT.

Metrorail as defined in the Dulles Corridor does not have the ability to carry 50,000 to 60,000 passengers per hour. As noted above, it would have a maximum capacity of 9,600 passengers per hour.

Public Comment: Bus service, even if equal to rail service in all respects, would attract only seventy (70) percent of the rail passengers that rail service would, according to Transportation Research Board Special Report 1221 of 1989. A more recent TRB report by Professor Gregory L. Thompson found in an analysis of the 1990 US Census in Sacramento's suburbs that electric rail service attracted sixty to seventy (60-70) percent more riders than equal bus service would. These are not theoretical computerized projections. These are mathematical measurements of the real world. (0013, 0013-L –9)

Response: *Metrorail does provide many advantages over bus service, including higher passenger capacity and higher operating speeds. These advantages were reflected in the higher estimated ridership for the Metrorail Alternative.*

Public Comment: The Dulles Rail Line should be very similar to BART. Each bus driver can move only 80 passengers maximum comfortably, but a single MetroRail operator can move 720. If buses have their own right-of-way and stations, far more bus labor will required for maintenance and staffing. (0013, 0013-L –12)

Response: *It was correct to comment that BRT would have required more drivers to provide the same level of capacity that a single Metrorail train could provide but there are other operating costs associated with Metrorail, including track maintenance, Metrorail vehicle maintenance, and traction power that were not associated with BRT. Total annual operating costs for each alternative were outlined in Table 6.3 –12 of the Draft EIS. Total operating costs were considered in the selection of the Locally Preferred Alternative.*

Concern for Costs Associated with Metrorail

Public Comment: If metrorail costs eight to 10 times more, is metrorail really worth $2.8 billion to $3 billion more? What are the advantages that would possibly make that the case? (0138, 0169-T –2)

Public Comment: What is it about metrorail that justifies doubling the Dulles road tolls starting next year, increasing the BPOL tax and the sales tax, and imposing a new special tax on commercial office and rental apartments? (0138, 0241-T –4)

Public Comment: METRO has been an unmitigated failure, costing 500% of its estimate to build and running an ever-growing operating deficit every year, both totally different than what the public was told when it was proposed. This is typical of urban mass transit projects. Why would the Dulles Corridor effort be any different? (0299, 0299-E –1)

Public Comment: What is it about metrorail that justifies spending $3 billion more than the BRT costs? (0138, 0241-T –2)

> ***Response:*** *As outlined in Chapter 10 of the Draft EIS, Metrorail had several benefits relative to BRT. In general, Metrorail provided greater improvements in transportation service, greater increases in transit ridership, more support for future development, and it would have better served diverse populations. Specifically, Metrorail would have had the highest ridership, highest number of new riders, and highest corridor transit mode share among the Build Alternatives. Metrorail was the most time competitive with automobiles for trips within the corridor. For these trips, as well as trips to and from the corridor, Metrorail required the fewest number of transfers. Metrorail provided the greatest increase in person-capacity in the corridor. Metrorail also provided the greatest benefits for the Orange Line, in terms of relieving overcrowding on the Vienna service.*
>
> *In addition, Metrorail supported comprehensive plans in Tysons Corner better than BRT, and allowed for higher growth in station areas throughout the corridor. Metrorail also served minority populations in the Tysons Corner area better than BRT.*
>
> *The advantages of BRT relative to Metrorail included improvements in corridor transit service at an earlier date, fewer impacts on the natural environment, fewer noise and visual impacts, lower traffic impacts in the vicinity of stations (though still higher than the No-Build), lower costs, and higher cost effectiveness (while Metrorail attracted more riders than BRT overall, the BRT Alternative cost much less than the Metrorail Alternative to build; therefore, the cost effectiveness for the BRT Alternative was lower). The final summary of the relative benefits and impacts of each alternative were outlined in Table 10.2-1 in the Draft EIS.*
>
> *The decision-makers considered these factors in their selection of the Metrorail Build Alternative as the Locally Preferred Alternative. Concurrently, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Ridership Forecasts

Public Comment: ACTION REQUESTED

1. Calculate new riders as someone who is new to using transit, not someone who used the Orange Line or a bus before.
2. Don't count rail riders as two trips if the person arrive by bus.
3. Explain why there are 11,000 fewer boardings at Vienna, Dunn Loring and East Falls Church in 2025 with Dulles rail over the base case (no rail).
4. Use average speeds to determine ridership and ride times, not "permitted attainable speeds." Provide station-to-station travel times for ALL stations, including BRT. A matrix would be helpful.
5. Do any ridership numbers include passengers who shifted from bus to rail?
6. How much of the regionally approved forecast riders (Table 22-2) is from outside the corridor?
7. Why do the total trips differ from table 22-1? What's the difference between riders and boardings? (0112, 0462-L –30)

Public Comment: How much of the regionally approved forecast riders (Table 22-2) is from outside the corridor? (0112, 0382-L –20)

Public Comment: Why do the total trips differ from Table 22-1? What's the difference between riders and boardings? (0112, 0382-L –21)

> ***Response****: The "new riders" information contained in Table 6.3-8 of the Draft EIS reflected totally new transit trips (rail and bus) and did not count people shifting from the Orange Line or other transit modes. They also did not double count people who started their trip on bus and then transferred to Metrorail or BRT. The 11,000 fewer boardings at Orange Line stations reflected the fact that riders living in the Dulles Corridor would board in the corridor rather than driving to an Orange Line Station. Total travel time (which translates into an average speed), not permitted attainable speeds, was used to determine ridership. Station-to-station travel times were included in the Transit Operations and Maintenance Plan (June 2002). Ridership estimates showed that approximately 27,000 rail trips would have been attracted into the corridor from outside the corridor under Metrorail Alignment T6 (the selected LPA). The numbers in Table 22-1 reflected new transit riders on a regional basis. The numbers in Table 22-2 referred to trips in Tysons, Reston, and Herndon. Boardings referred to a specific boarding at a rail station. A trip included all of the legs of a trip, including transfers from bus to rail.*

Public Comment: Only 32,700 of the 71,900 weekday passengers are estimated to be "new" passengers so the difference will be Orange Line passengers and bus riders shifting over to the Dulles Line. This will make more room for Orange Line passengers. In 2002, from 6:45am to 8:45am and from 4:15pm to 6:15pm, the Orange Line moves 164 cars in the prevailing direction, with proper space for 20,000 passengers in each peak period. With Dulles Rail in 2010, there should be 242 cars in the peak two hours, with space for 29,500 passengers. (0013, 0013-L –31)

> ***Response:*** *It was anticipated that passengers from the Dulles Corridor that now drive to Vienna or Dunn Loring to access Metrorail service would board in the Dulles Corridor, thus alleviating crowding on the Orange Line from Vienna. This shift to the Dulles Line was reflected in the car loadings on the Orange Line under the No-Build versus the Metrorail Alternative, as shown in Table 6.3-6 of the Draft EIS. Loadings on the Orange Line decreased for each of the Metrorail alignment options relative to the No-Build Alternative.*
>
> *Existing peak hour, peak direction service on the Orange Line was comprised of a mix of 4 and 6 car trains on two different services (Vienna and 'Tripper' services). Combined, these two services currently provide peak hour passenger carrying capacity of 12,000 based on six minute headways and WMATA's loading standard of 120 passengers per car. This capacity would have increased to 19,200 in 2010 based on an increase in train length (but no change in service frequencies), as analyzed in the Draft EIS.*

Public Comment: With 32,700 "new" passengers, it is likely that only 5,750 will be in the peak two hours, so there should be fewer standees with Dulles Rail than without it. Some Reston, Herndon, and Loudoun commuters who now drive to Vienna or West Falls Church to park will use the Dulles line making room for more new passengers on the Orange Line. (0013, 0013-L –32)

> ***Response:*** *For the Draft EIS, the Project Team did not estimate ridership in the peak two hours. However, based on available data, it was anticipated that passengers from the Dulles Corridor that drive to Vienna or Dunn Loring to access Metrorail service would have boarded in the Dulles Corridor, thus alleviating crowding on the Orange Line from Vienna. This shift to the Dulles Line was reflected in the car loadings on the Orange Line under the No-Build versus the Metrorail Alternative, as shown in Table 6.3-6 on page 6-46 of the Draft EIS. Loadings went down on the Orange Line for each of the Metrorail alignment options relative to the No-Build Alternative, as analyzed in the Draft EIS.*

Public Comment: Mid-day, the Orange Line service will be doubled from East Falls Church east, and the number of cars will increase by 33 percent on busy days and 100 percent on lights days when four-car trains are used. This will be good for every one. As ridership continues to grow in the more distant

years, more cars and more service will be needed, but experience will tell us how much. The capacity will be there, within realistic limits. (0013, 0013-L –33)

> ***Response:*** *Orange Line service will increase under the LPA during the mid-day, east of East Falls Church. Currently mid-day service consists of trains from Vienna running every 12 minutes. Since the Metrorail Alternative has been selected as the LPA, a 12 minute mid-day Dulles service will be added, thus resulting in a combined six minute frequency east of East Falls Church. Future mid-day train lengths on both services will be 4 cars, with the exception of the Vienna-New Carrollton Orange Line in the summer, which will have a mix of 4 and 6 car trains..*

Public Comment: Enough Trains and Seating: During rush-hour on the west end of the Orange Line, if you don't get on the train at Vienna or Dunn Loring stations, you will not ever, ever get a seat. Imagine that there are people who travel the Metro to places between West Falls Church and Farragut West who have never got to sit down going to work or going home. I bet they are looking for an alternative or anything that includes sitting down. (0108, 0108-E –3)

> ***Response:*** *It is anticipated that passengers from the Dulles Corridor that now drive to Vienna or Dunn Loring to access Metrorail service will now board in the Dulles Corridor, thus alleviating crowding on the Orange Line from Vienna. This shift to the Dulles Line was reflected in the car loadings on the Orange Line under the No-Build Alternative versus the Metrorail Alternative, as shown in Table 6.3-6 of the Draft EIS.*

Public Comment: I am looking for ridership estimates for any of the modes? Can you provide those estimates to me by station as well as full length of each line? (0112, 0112-E –1)

> ***Response:*** *Passenger boardings by station or stop for each of the Build Alternatives were included in the Draft EIS in Table 6.3-10. More detailed ridership data was available in the Travel Demand Forecasting Methodology and Results Technical Report Appendix (June 2002). These boardings by station have been replaced by the ridership forecasts of the Wiehle Avenue Extension and Full LPA presented in Section 6.1 of the Final EIS.*

Public Comment: The evaluation of T4 identifies several disadvantages that either appear to be incorrect or can be mitigated. The draft EIS forecasts transit ridership for T4 that is less than the other rail alignments. This forecast is inconsistent with the other data presented in the draft EIS that shows T4 brings transit to the greatest number of residents and employees. The ridership projections are artificially depressed by assuming the one way loop alignment will prevent huge numbers of potential riders from choosing to use transit. (0084, 0084-L –3)

Public Comment: The evaluation of T4 identifies several disadvantages that either appear to be incorrect to can be mitigated. The draft EIS forecast transit ridership for T4 that is less than the other rail alignments. This forecast is inconsistent with the other data presented in the draft EIS that shows T4 brings transit to the greatest number of residents and employees. The ridership projections are artificially depressed by assuming the one-way loop alignment will prevent huge numbers of potential riders from choosing to use transit. The Metro system, like most large transit systems, depends on line transfers. Riders from suburban locations are accustomed to transferring lines to get to their destination. The effect of the additional transfer on one leg of rider's round trip is overstated in the ridership forecasts. Based on the significant difference in station area population and employment, the ridership should be much greater for Alignment T4. Regardless of the effect on longer transit trips, no other alignment creates any internal transit system within and through Tysons Corner, which T4 would. This will also serve to increase ridership. (0084, 0458-E –3)

> ***Response****: For the Draft EIS, the demand forecasting model used to estimate ridership for each of the Metrorail alignments took into account a number of factors including overall trip time (including access to the station), station proximity to key employment concentrations, station proximity to residential concentrations, and ease of station access for pedestrians, autos, buses, and other modes. The same model algorithms and procedures were applied to each alternative in*

order to ensure consistent results. It should be noted that transfers do carry a penalty in calculating trip times. This is because surveys have shown that riders perceive wait times for transfers to be longer than the wait times actually are. Because of this people avoid transfers and will often not make a trip by transit if a transfer is required. This transfer penalty is reflected in the lower ridership numbers associated with Alignment T4. As an example, if Alignment T4 had been part of the selected LPA, anybody wishing to go east who boards at Tysons Central A or Tysons Central B under T4 would have first gone west to the Tysons West station, where they would then have transferred to a westbound train. This added time to the overall trip and included the transfer penalty as well. The same held true for eastbound passengers who wished to go to Tysons Central A or Tysons Central B. Finally anybody making a trip to Tysons from the east and wished to get to Tysons Central C or Tysons Central D (the commercial core of Tysons) would have stayed on the train through Tysons and then transferred at Tysons West for an eastbound trip.

A more detailed description of the demand-forecasting model has been available in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

Public Comment: Given the proposed level of improvement afforded by any of the rail alternatives, it's inconceivable to me that the number of new riders in this corridor is as low as claimed in the report and it's impossible to ascertain the validity of these projections with the background information presented. Obviously, the number of new riders is a critical consideration as the cost per new rider is one of the important evaluation factors FTA presently uses to compare projects across the country which are competing for a limited amount of federal funding, a limited amount that's very likely to become even more limited in the future. (0387, 0387-L –8)

***Response**: The methodology for completing the ridership estimates for the Draft EIS was outlined in detail in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). The NVMISM model used for the Project ridership projections was an adaptation of the Metropolitan Washington Council of Governments model used to estimate regional travel flows and transportation demand. FTA reviewed the forecasting methodology used in the Draft EIS and gave its approval. Additional modifications requested by FTA have been incorporated into the model runs for the Final EIS.*

Public Comment: One also has to question the figure of 31-33,000 new boardings on rail given an anomaly in the boardings data provided in "Travel Demand Forecasting Methodology and Results - Appendix." One of the tables, "Rail/BRT Station Activity: 2025 Base" shows the following total boardings without Dulles Rail, and with the highest ridership projected alternative for Dulles Rail (Alternative T6): Why would there be about 11,000 fewer boardings at the Vienna, Dunn Loring and West Falls Church Orange Line stations in 2025 when Dulles Rail is factored in? (See Exhibit 4) WMATA and VDRPT need to explain this because there are also dropoffs in numbers for other Dulles Rail alternatives. Perhaps one can assume that the reason there are fewer boardings at these three stations is because these folks are using Dulles Rail instead, leading to this question - how much of the boardings you are projecting for Dulles Rail are actually diversions from the Orange Line? It would seem from this phenomena that 1/3 of the boardings are coming off the Orange Line. Obviously, commuters who previously had to drive to Vienna, Dunn Loring or West Falls Church can use the Dulles Rail line instead. But there are no similar data for BRT, so don't know if BRT draws people off the Orange Line. (0112, 0462-L –27)

Public Comment: Why is there a drop in daily boardings in 2025 at the Vienna, Dunn Loring, and West Falls Church stations? I counted about 11,000 fewer boardings at these stations in 2025. Why? Are these boardings folks who would use Dulles Rail instead of the Orange Line? (0112, 0382-L –18)

***Response**: The Vienna, Dunn Loring, and West Falls Church stations are currently the point of access to the Metrorail system for riders from the Dulles Corridor. Once the Metrorail Extension is implemented, Dulles Corridor riders will no longer have to access one of these stations in order to utilize Metrorail, since there will be a station closer to home. This explains the drop in boardings at these stations.*

Data on station boardings under each of the BRT alignment options, versus the No-Build Alternative, were included in the Travel Demand Forecasting Methodology and Results Technical Report Appendix (June 2002). These data showed that there would have been some diversion from the Orange Line to BRT stations, though the shift would not have been as significant as will occur under the Metrorail Extension.

Public Comment: More details on the development of the ridership projections are required. It's not clear how the ridership projections for the Tysons Corner stations, or any of the other stations for that matter, were developed. More information is needed on the service areas assumed for each station, the level of development assumed for each station service area, transit and other shuttle systems feeding the station (particularly in the Tysons Corner area) and especially important, how the number of new riders was determined. (0387, 0387-L –6)

***Response**: The methodology for completing the ridership estimates in the Draft EIS was outlined in detail in the Travel Demand Forecasting Methodology and Results Technical Report, (June 2002). The model used for the project ridership projections was an adaptation of the Metropolitan Washington Council of Governments model used to estimate regional travel flows and transportation demand (the model is adapted from the regionally focused model to one which is more corridor focused). Regarding development levels, the travel demand forecasts in the Draft EIS were based on the Metropolitan Washington Council of Governments' Round 6.2 Cooperative Land Use Forecasts. For the Final EIS, the Round is 6.3. These Rounds forecast represent the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun County. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. The feeder bus system for each Build Alternative in the Draft EIS was described in great detail in the Transit Operations and Maintenance Plan Technical Report (June 2002).*

Public Comment: What is the projected increase in the number of people expected to come into the corridor each day as the result of rail being constructed and what percentage of these are expected to use rail or other mass transit? (0454, 0454-E –5)

***Response**: In the Draft EIS, total person trips into the corridor were not anticipated to change significantly under any of the Build Alternatives. Rail trips into the corridor from outside the corridor (this does not include intra-corridor trips) would increase by nearly 27,000 with the Metrorail Alignment T6, which has been selected as the LPA). This data was included in the Production/Attraction tables in the Travel Demand Forecasting and Methodology Results Appendix, June 2002.*

Public Comment: We also encourage you to reexamine the DEIS evaluation of T4, which we believe draws some conclusions that may not be entirely justified. The DEIS forecasts lower transit ridership for T4 than for the other rail alignments, contradicting other data in the DEIS showing that T4 provides Metro access to a larger number of residents and employees. The DEIS projects the one-way loop alignment would decrease ridership by discouraging a large number of potential riders. We contend, however, that this has been overstated and that the effect on ridership of the additional transfer on one portion of a round trip would be insignificant. (0455, 0455-L –2)

Public Comment: Regardless of the effect on longer transit trips, no other alignment creates any internal transit system within and through Tysons Corner, there we assert that T4 would greatly increase ridership. (0455, 0455-L –3)

Public Comment: The Metro system, like most large transit systems depends on line transfers. Riders from suburban locations are accustomed to transferring lines to get to their destination. The effect of the additional transfer on one leg of a rider's round trip is overstated in the ridership forecasts. Based on the significant difference in station area population and employment, the ridership should be much greater for alignment T4. Regardless of the effect on longer transit trips, no other alignment creates any internal

transit system within and through Tysons Corner, which T4 would. This will also serve to increase ridership. (0084, 0084-L –4)

***Response**: The demand forecasting model used to estimate ridership in the Draft EIS for each of the Metrorail alignment options took into account a number of factors when producing ridership estimates. These factors included overall trip time (including access to the station), station proximity to key employment concentrations, station proximity to residential concentrations, and ease of station access for pedestrians, autos, buses, and other modes. The same model algorithms and procedures were applied to each alternative in order to ensure consistent results. It should be noted that transfers did carry a penalty in calculating trip times. This was because surveys have shown that riders perceive wait times for transfers to be longer than the wait times actually are. Because of this people avoid transfers and will often not make a trip by transit if a transfer is required. This transfer penalty was reflected in the lower ridership numbers associated with Alignment T4. As an example, if Alignment T4 had been the selected LPA, anybody wishing to go east who would have boarded at Tysons Central A or Tysons Central B under T4 would have gone west to the Tysons West station, where they would have then transferred to a westbound train. This added time to the overall trip and included the transfer penalty as well. The same held true for eastbound passengers who would have gone to Tysons Central A or Tysons Central B. Finally anybody making a trip to Tysons from the east and wished to get to Tysons Central C or Tysons Central D (the commercial core of Tysons) would have stayed on the train through Tysons and then transferred at Tysons West for an eastbound trip.*

A more detailed description of the demand-forecasting model was available in the Travel Demand Forecasting Methodology and Results Draft Technical Report (June 2002).

Commuting Costs

Public Comment: Will people use BRT? In Maryland, Montgomery County recently made a number if the County's bus routes free to users. Bus ridership increased about 15 percent during that time, which isn't too bad. It says a lot about the sensitivity of area workers about the costs of commuting, and it also shows what the probable reaction will be from the low to moderate-income workers who have to use the Toll Road if the tolls are increased. (0183, 0183-T-7)

***Response:** As shown in Table 6.3-8 in the Draft EIS, between 47,100 and 49,400 people would have ridden BRT per day in 2025, depending on the BRT alignment option. The fares charged to ride BRT would have been consistent with those charged to ride on the Metrorail system.*

Mode Transfers

Public Comment: Most of the travel is to and from Arlington and Washington, D.C. which requires a physical transfer between bus and MetroRail at West Falls Church. This inhibits transit use but would become a bottleneck if use expanded too much as the projected transit travel is too great for such a transfer. The crowding, congestion and delay would severely inhibit use. (0013, 0013-L –6)

***Response:** Transfers between modes (i.e. bus to rail) would increase rider inconvenience and thus could inhibit transit ridership. This transfer penalty was incorporated into the demand forecasting model used on the project. The bus transfer facility on the north side of the West Falls Church station has been near capacity so additional bus service into the facility could, at some point, result in degraded operations.*

Public Comment: While what I call Tysons rail can be appropriate if accompanied by walkability to Tysons, there is not much hope of what I call Western rail to have a good cost-benefit ratio. In fact, I cannot believe that anyone who seriously proposes the Reston rail segment has both ridden transit regularly and looked at the numbers. According to the 1997 Major Investment Study, a mere 1 percent - that's 1 percent -- of the riders of the combined Tysons-Western rail system would be going to or from Dulles airport itself. In contrast, 50 percent of the users of the combined Tysons-Western rail system

would be residents living west of Tysons, commuting all the way into Arlington and D.C. These users are much better served by existing transfer-free, door-to-door express buses. (0134, 0134-T –7)

> ***Response:*** *One of the primary advantages of the Metrorail Alternative in the Draft EIS versus the existing express service was that trips within the Dulles Corridor would be much better served by transit. As noted, the existing express service does a good job of serving peak direction trips into the region's core, including Arlington, Alexandria, and downtown Washington, D.C. However, the existing bus service does not serve intra-corridor trips well. This was proven by the increase in intra-corridor transit mode share versus the No-Build Alternative. This data was contained in the Travel Demand Forecasting Methodology and Results Technical Report Appendix (June 2002). In all instances except one, transit mode share for intra-corridor trips increased over the No-Build. This increase reflected the much higher quality service available to passengers wishing to make intra-corridor trips (the one Origin/Destination pair where mode share falls is for trips within Tysons. This reflected the fact that some bus service serving intra-Tysons trips is modified as part of the Metrorail Alternative in the Draft EIS).*
>
> *In addition, express bus trips might have still required a transfer to Metrorail because there were multiple destinations within the core. It would not be possible to serve all of these multiple destinations with dedicated express service. The Metrorail system is required for the distribution of passengers to multiple destinations.*

Public Comment: As for commuting to Herndon, Reston, places of business, only 12 percent of the users of combined Tysons-Western rail system would be doing that, or about 6000 people. The number is so low, of course, because due to the highway median station placement and unwalkable sprawl development, the people would have to take shuttle or circulator buses after their metrorail rides. More time-consuming, disruptive transfers. (0134, 0134-T –9)

> ***Response:*** *Total transit trips from areas outside of Reston and Herndon to these areas were calculated by the demand forecasting model for the Draft EIS and were included in the Travel Demand Forecasting Methodology and Results Technical Report Appendix (June 2002). The data showed (for Metrorail Alignment T6 and T9 of the Draft EIS) that the number of transit trip going to Reston is 8,767 on a daily basis. The number of trips going to Herndon on a daily basis is 6,747.*

Public Comment: Most of you have probably seen the articles about how much we love our cars. The presumption that commuters will take buses to Metro is unsupported by either evidence or current practice. They're going to use their cars. (0150, 0150-T –5)

> ***Response:*** *Mode of arrival at each station is one of the pieces of data that is generated by the travel demand forecasting model. The model results do show that driving to a station will be the predominant mode of arrival for stations that do have parking, but the data also show that large numbers of passengers will be arriving via both bus and walking. For instance, based on analyses in support of the Draft EIS, 59 percent of passengers are projected to arrive at the Herndon-Monroe station by auto, but 19% are projected to arrive by bus. At Route 28, the percentages are 18 percent and 44 percent respectively, while at Wiehle Avenue the percentages are 24 percent and 45 percent respectively with the selected LPA).*

Characteristics of Express Bus Service

Public Comment: During the FEIS and rail PE process we need hard work on…Many BRT characteristics should be incorporated in an improved express bus system (pre-payment of fares, rapid boarding of buses at park and ride facilities, provision of real-time bus arrival information, accurate schedules at all stops, improvements in neighborhood service, much improved timed-transfer services, fine-tuning of service to fit changing demand, etc.). (0173, 0213-M –7)

***Response**: The express bus services currently running in the corridor are the responsibility of Fairfax and Loudoun counties, respectively. The Project Team has recommended that the existing transit service provided by Fairfax and Loudoun Counties be further enhanced beyond the bus rapid transit elements that have already been added. Prior to the opening of LPA Phase 1, additional bus rapid transit elements—including the expansion of the Herndon-Monroe park-and-ride lot (site of the future Herndon-Monroe Metrorail Station), ITS enhancements, and facility improvements—should be advanced.*

Mode Shift

Public Comment: Are there any shifts from buses to rail in the forecasted ridership? (0112, 0382-L –19)

Public Comment: How many other Dulles Rail passengers are diverted from Metrobus? It is reasonable to assume this. A 1996 COG study found that of 600,000 Metrorail riders, about 450,000 of them were actually previous bus riders. Hence, most of Metro's ridership is not "new people to transit," but people whose bus service was cut out when rail was extended to various locations. So, how many of your 30,000 to 33,000 new riders/trips are people who would have used Metrobus or the Fairfax Connector service? It is reasonable to assume that besides the drift of passengers from the Orange Line to the Dulles line, is it not possible that some of those 30,000-33,000 trips/boardings in 2025 are former bus users? (0112, 0462-L –28)

Public Comment: What percent of automobile trips will be attracted to each transit alternative for each of the areas? (0147, 0459-L –28)

***Response**: Yes. As presented in the Draft EIS, many of the trips now made by bus in the corridor would shift over to BRT or Metrorail. An important set of these trips would be those riders currently using Fairfax Connector express services to West Falls Church Station. Since the Wiehle Avenue Extension has been identified as the first phase of the Full LPA, this service would be provided by Corridor express bus service that will feed into the Wiehle Avenue Station. The last row in Table 6.1-3 of the Final EIS presents new transit trips, not trips that were attracted from another transit mode.*

Data on the specific number of trips once made by automobile that would shift to transit was not calculated as part of the Draft or Final EIS. However, a very good proxy for this is shown in Table 6.1-5 of the Final EIS. This table shows the changes in mode share (the portion of all corridor trips that are completed by transit). The data in this table show that the Full LPA will increase the transit mode share by approximately 4 percent in Tysons Corner, approximately 3 percent in the Reston area, approximately 3.5 percent in the Herndon/Dulles area, and 1. percent in eastern Loudoun County. These overall increases in transit mode share reflect people shifting from their automobiles to transit.

Need for Clarification of "New Riders" Versus "New Trips"

Public Comment: WMATA and VDRPT also express "new trips" and "new riders" interchangeably. They do not explain why there are 11,000 fewer boardings on three Orange Line stations in 2025 when Dulles Rail is factored in - leading to an assumption that of 53,000 estimated boardings on Dulles rail, 11,000 are not new boardings. WMATA and VDRPT also do not explain if any of the new riders are in fact people new to transit, or just people who formerly used buses. (0112, 0462-L –6)

Public Comment: But it is also difficult to distinguish "new riders" from "new trips" and "boardings" for Metrorail alternatives (T1, T4, T6, T9). It appears the terms new trips and new riders are used interchangeably when in fact new riders refer not to new individuals using the facility but new trips. Under this definition a new transit rider traveling to work and back is counted as two new riders. This is very misleading. (See Vol I Chap 6.3.4.1, Tables 6.3-8 and 6.3-9) For argument purposes, I will work with the

"new riders" numbers, which range from 37,300 to 38,500, or "total boardings" in 2025, which ranges from 31,000 to 33,000. (0112, 0462-L –23)

Public Comment: Lack of Definitive New Rider Estimates. The DEIS fails to provide a count of the number of new individuals estimated to make use of Dulles corridor transit. Data presented as "new riders" is actually the number of new trips. Given that most new riders will make multiple trips per day, DEIS estimates significantly overstate the actual number of new persons likely to use this service. The general public needs a more definitive estimate of actual number of new persons using this system. (0446, 0446-E –4)

> ***Response****: Table 6.3-8 of the Draft EIS did use the terms new riders and new trips interchangeably. The new riders column in the table did not refer to a new person or individual now taking transit (a person would presumably make two trips per day) because of implementation of the BRT or Metrorail Alternative. Rather the column referred to the new number of total trips by riders resulting from implementation of either Metrorail or BRT. The Project Team did not estimate new riders because the number of trips, or boardings, is of greatest relevance for station area planning, operations planning, and the Federal New Starts funding process. The fewer boardings at Orange Line stations reflected the fact that Dulles Corridor riders now boarding on the Orange Line would access rail at Dulles Corridor stations in the future. This shift of existing riders was not reflected in the new riders (or new trips, as explained above) column in Table 6.3-9 of the Draft EIS. The numbers in this column reflected entirely new transit trips.*

Model Forecasting Programs

Public Comment: COG version 2 is now available and validated. The project Team should rerun numbers using Version 2, and compare the results with the NVMISM model. (0112 10-1)

> ***Response:*** *For the analysis in support of Final EIS and New Starts criteria, the Project Team chose to retain the NVMISM travel demand forecasting model of the Draft EIS.*

Service Qualities

Public Comment: Express rail service that would bypass Tysons Corner was properly dismissed, but it was not made sufficiently clear that express service would destroy service quality for everyone while increasing costs. Noted that headway degradation and overloaded local versus express trains due to demand for travel to Tysons. Also noted “bunching” effect of differences in travel times for local versus express service. (0013 10-1)

> ***Response****: In response to the above requests, the Project Team evaluated the suggested alternative using the same social, environmental, economic, and transportation factors used for the evaluation of alternatives documented in the* Final Alternatives Analysis Report *(May 2001). This new alternative, called Alignment T12, was not recommended for further consideration in the Dulles Corridor Rapid Transit Project. The reasons for this recommendation are summarized below.*
>
> *Alignment T12 would have numerous deficiencies relative to the alternatives previously considered in the Final EIS. These deficiencies include increased costs, substantial impacts associated with shifting roadways to accommodate the alignment, reduced ridership, and operational complications.*
>
> *The full evaluation for Alignment T12 is documented in a technical memorandum, now part of the Final Alternatives Analysis Report Addendum (October 2004).*

B. Supplemental Draft EIS Comments

Regional Agency Comments

Coordination with Dulles Airport Layout Plan

Regional Comment: Regarding issues to be resolved (page 10-5), it should be noted that the current Airport Layout Plan (ALP) for IAD dated February 2003 does include a rail alignment and a proposed rail yard on Airport property. Although the rail alignment shown on the ALP in the area northeast of the Main Terminal differs somewhat from that shown in the SDEIS, the Airports Authority is committed to working with the Virginia Department of Rail and Public Transportation to facilitate the FAA approvals necessary for the project.
0131 0166-6

> ***Response:*** *The current alignment of the Full LPA was included in an update to the Dulles International Airport ALP that was approved by FAA in March 2004.*

Public Comments

High Rail Cost

Public Comment: Rail simply costs too much and does too little.
0061 0069-15

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in selecting the LPA.*

No Build is Not Adequate

Public Comment: 4.4 buses will be needed in each direction to carry what Dulles Rail would have carried. Since it is not possible to build 0.4 lane, fire lanes will be necessary, each way. Ten lanes from Washington DC to Herndon VA would cost very roughly $11 billion, over five times as much as Dulles Rail. People need to know. No build is not a choice unless we want to tolerate gridlock, economic stagnation or decline, air pollution, loss of federal financial aid we paid for and intolerable living conditions.
0054 0055-5

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in selecting the LPA.*

Comments to FTA

Public Comment: Defective DEIS: To the extent the SDEIS relies on the DEIS, we incorporate our comments in our letter to The Honorable Jennifer Dorn, Administrator, Federal Transit Administration, dated Nov. 4, 2003, [Re: New Starts Program: Pending Va. DRPT/WMATA Application for Authorization Preliminary Engineering Dulles Corridor Rapid Transit Project] with attachments.
0072 0150-2

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in selecting the LPA.*

11.0 COMMENTS, CONSULTATIONS, AND COORDINATION

11.1 Public Involvement

A. Draft EIS Comments

State Agency Comments

Dulles Corridor Steering Committee

State Comment: Pg. 11.16. - Dulles Corridor Steering Committee is "composed of the executives from each of the project's funding partners". Suggest adding that the committee is chaired by a member of Virginia's Commonwealth Transportation Board (CTB), representing VDOT and VDRPT. (0421, 0421-A – 22)

> ***Response****: The following sentence has been added to Section 11.2 of the Final EIS: 'The CTB representative also represents the Virginia Department of Transportation on the Steering Committee.'*

Regional Agency Comments

Need to Identify Best BRT Station/Stop Location

Regional Comment: The Airports Authority has not yet determined the best location for a BRT stop/station at the Terminal Building. Though the general plans call for three bus parking positions at the easternmost end of the commercial vehicle curb, the Airports Authority's desire is to further study the best location for a BRT facility if a BRT system becomes a part of the locally preferred alternative. (0440, 0440-A –17)

> ***Response****: The BRT Alternative was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comments

Opportunities for Public Input

Public Comment: Perhaps most disconcerting to TMS is the fact that throughout the more than 2 years WMATA was drafting the DEIS, WMATA never approached TMS to express an interest in acquiring or accessing TMS's property. In fact, WMATA never inquired about the effect its plans would have on TMS or the fact the BRT bridge and 2,000-car parking garage could shut down Tysons Self Storage and segregate the property from its neighbors and access to Route 7. It was not until earlier this year when the owners of TMS discovered an anonymous real estate appraiser hired by WMATA to investigate the Tysons Self Storage facility, that TMS realized its property was affected by the Tysons West station and associated facilities. More importantly, only after TMS called WMATA officials to complain about the appraiser and request a meeting did WMATA meet with TMS to advise them of WMATA's plans. That meeting occurred on March 28, 2002. For the first time, WMATA indicated that the DEIS would include designs for an aerial bridge across the TMS Property. By contrast, WMATA has been meeting with affected landowners, community stakeholders and many other citizens for years to discuss the various plans an alternatives; these meetings have even occurred with owners of properties not directly affected. When TMS expressed concerns to WMATA officials about the lack of notice and the impacts of the bridge, WMATA officials encouraged TMS to use the DEIS hearings as the forum to air its concerns; WMATA was not going to amend the DEIS at such a late date. Further, following release of the DEIS and TMS' inquires about shifting the BRT bus bridge off the TMS Property, WMATA suggested that TMS should supply alternative designs that relocate the bridge to neighboring properties, without debating the

need for its construction. For TMS, that is akin to being asked to select the method of its death, rather than being given the option of seeking a reprieve. As was noted earlier, construction of the BRT bridge, whether wholly on TMS's Property or shared with a neighbor, represents a physical and psychological barrier to the opportunity to create pedestrian-friendly, transit-oriented development, as the County's Comprehensive Plan envisions. (0135, 0391-L –18)

***Response**: We apologize for not meeting with TMS regarding the Tysons Self Storage Facility sooner. The public hearings for the Draft EIS provided an excellent opportunity for TMS to participate in the project and to review and comment on the Draft EIS. The BRT/Metrorail and Phased Implementation Build Alternatives that would have affected TMS were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: Who is the FTA rep on the project team? (0112, 0382-L –2)

***Response**: The FTA point of contact is Mr. Brian Glenn, Director, Washington Metropolitan Office. He can be reached at (202) 219-3562.*

Public Comment: The above stated items are only the tip of the iceberg. We [Chathams Ford Drive] would gladly entertain a meeting with you and other officials to further discuss these matters. (0383, 0383- L- 7)

***Response**: The Project Team would be happy to meet with the residents of Chathams Ford Drive. Please call the Project INFO Line at 1-888-566-7245 to schedule a meeting.*

Public Comment: Suggests that many of the project meetings were “secret” and not open to the public. (0486 01)

Public Comment: Opposes the use of on-call consultants rather than public agency employees. Suggests that the project is based on improprieties since DRPT was able to bypass state contracting regulations. (0486 02)

***Response:** The Virginia Department of Rail and Public Transportation (DRPT) is the project sponsor. Its approach to project development entails the following: 1) that DRPT is the program manager, Federal grant applicant and recipient, design/build contracting authority and initial owner of the Project, and 2) that WMATA is DRPT`s technical manager of NEPA process, of preliminary engineering (PE) and of the design/build contract and will be the leaseholder of the Project, its operator and ultimate owner.*

DRPT has received FTA approval and funding to conduct preliminary engineering on the first phase of the Project, the Extension to Wiehle Avenue. All preliminary engineering activities that involve FTA grant management, FTA liaison and FTA project management oversight are the responsibility of DRPT. DRPT has negotiated and executed a Comprehensive Agreement with Dulles Transit Partners, LLC (DTP) to be its preliminary engineering consultant. DTP is a partnership of Bechtel Corporation and Washington Group International. WMATA will assist DRPT in the management of DTP.

For development of the project, DRPT is responsible for right-of-way acquisition, environmental permitting, interagency agreements, utility agreements, final financial plan, funding agreements and coordination with Federal, state, and local agencies.

The method used for scheduling meetings between representatives of the Office And Professional Employees International Union, Local No. 2, AFL-CIO and WMATA management is beyond the scope of the Draft EIS, Supplemental Draft EIS and Final EIS. It is suggested that the Local No. 2 representatives request a briefing through normal WMATA channels.

Public Comment: First some brief history so you will understand our justifiable skepticism: Sham Meetings - when the Dulles Access Road was first constructed, many public meetings were held just as is currently being done. The presenters sounded sympathetic but then proceeded to do exactly what suited them without any significant attention paid to the concerns for the impacted citizenry. For example, the radius of the highway curve running along the north edge of the Lemon Road Civic Association was actually reduced to save money with no regard for the increased noise. The 80-100 feet of trees that were going to be left as a buffer were reduced to 0 feet! (0087, 0087-L –2)

Public Comment: Put aside the political issues swirling around and listen to what the community wants. Give them enough information about both sides of this plan, so commuters and the like, can be informed in an educated manner. (0107, 0107-E –2)

> ***Response:*** *The public comments received at the Public Scoping meetings (July 2000) and Public Information Meetings (January 2001) were considered in the development of the alternatives and in determining the range of issues to be studied in the Draft EIS. All comments received during the public hearings on the Draft EIS and proposed General Plans and on the Supplemental Draft EIS and revised General Plans were considered in the selection and revision of the Locally Preferred Alternative by WMATA's Board of Directors and the Commonwealth Transportation Board. Before and after the hearings and between the hearings there have been extensive public involvement activities.*
>
> *The Final EIS is being circulated to inform decision-makers and the public on the selection of the Metrorail extension as the LPA and on the potential consequences of implementing the proposed extension in the corridor. Overall, the potential adverse impacts of the extension on the human and natural environment are expected to be minor. Coordination with the public, stakeholders, resource agencies, and local governments has confirmed these findings.*
>
> *As the project enters preliminary engineering, any design changes will be monitored and if deemed likely to cause potentially significant effects, additional environmental documentation will be prepared to fully document these effects and measures to mitigate the effects if found to be substantial.*

Public Comment: Requests continued dialogue between design team and communities on project impacts and mitigation throughout the design process.(0388 11-3)

> ***Response:*** *As the NEPA process ends and the preliminary engineering begins, DRPT, the project sponsor, will continue an active community outreach program. It will continue to coordinate with adjacent communities and stakeholders*

Stakeholder Concerns

Public Comment: The Draft EIS refers to stakeholders as those who will experience an impact from one or more of the alignments or station locations. Northwestern clearly is a stakeholder, and should be added to the stakeholder list which appears on page J-6-3. (0461, 0461-E –2)

Public Comment: The Draft EIS does not define the term "stakeholders" as such. However, the Draft EIS refers to stakeholders as those that will experience an impact from one or more of the alignments or stations locations. NADA clearly is a stakeholder. Going forward, NADA requests that you add the Association to the stakeholder list that appears on page J-6-3. (0477, 0477-L –3)

> ***Response****: The Project Team has added you to the list of recipients of the Final EIS. Since you were not originally invited or possibly did not attend the stakeholder meetings of December 2000, you did not appear in the list of attendees in Appendix J-6 of the Draft EIS.*

Public Comment: All of the organizations and groups mentioned in the above recommendations should be brought together in another charrette in the near future to brainstorm ideas for implementation of these

and other related goals and objectives (including those in the DEIS, such as mitigation measures for traffic impacts). Following this charrette, Fairfax County should take the lead in establishing the appropriate implementation mechanisms. (0478, 0484-E –25)

> ***Response****: DRPT, the project sponsor responsible for project development, is willing to attend and/or make presentations at charrettes planned by Fairfax County or others.*

Public Comment: The Board of Directors, and through them, the Ownership, are ready to meet with you or other representatives to further discuss the improvement plans, especially Option T-4. Please continue to maintain contact with The Rotonda through our General Manager, Stephen C. Wright. (0220, 0220-M –2)

> ***Response:*** *Alignment T4 Alternative was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Nevertheless, DRPT, the project sponsor, remains available to continue coordination efforts with the Rotonda Board of Directors and their General Manager in regards to access to the stations of the selected LPA alignment.*

Coordination with Local Entities

Public Comment: You would certainly - should certainly work with local planners and citizens in defining what alternatives to analyze. This is not planning. It is providing your expertise to assist decision makers on these complex issues. It will constitute integration of land use and transportation planning. Hallelujah. Which is a mandate of the regional plan. And it can be part of the EIS. (0158, 0158-T –4)

Public Comment: It is the sincere hope of our [West Falls Village] Association that the Dulles Corridor Rapid Transit Project means it when it says in the EIS that it will "coordinat(e) with local communities to address outstanding issues related to facility design, potential effects, and mitigation." We look forward to seeing that the final project plans will include the construction of a noise barrier to protect our community so that we will be able to support this project. (0435, 0435-E –6)

> ***Response:*** *The Project Team has coordinated extensively with local government, public agencies, the general public, potentially affected property owners, civic associations, homeowners groups, businesses, and other stakeholders throughout the length of the environmental review process of the Project. DRPT will continue this coordination through preliminary engineering, final design, and construction.*

Comprehensive Agreements Among Stakeholders

Public Comment: We have suggested the following specific steps to DCRTP representatives: The negotiation and completion, as soon as possible, of a form of comprehensive agreement between the Dulles Greenway and the DCRTP sponsors, including WMATA, the Virginia Department of Rail and Public Transit (DRPT), and other sponsors who will be involved in the design, permitting, construction and operation of this project. This Comprehensive Agreement would cover such things as: Reimbursement of the Greenway for expenses incurred by the Greenway in connection with the design, permitting, and construction of the DCRTP. Redesign of the DCRTP to eliminate or reduce impacts on the Greenway outside of the existing median. In a nutshell, make it work within the existing median. Stormwater management ponds, tie breaker stations, transfer power switching stations, and the like should be located on land acquired by the project sponsors, outside the Greenway right of way. If the redesigned project cannot eliminate all impacts of the Greenway other than use of the existing median, the Greenway, as a private property owner, expects to be compensated for any use of its land. The agreement should address detailed construction standards and mitigation measures to ensure that construction is performed at night, off peak hour, and in a way that will minimize the impact on the Greenway's customers. The agreement should address detailed standards for operation and ownership of the DCRTP, to make sure that all additional costs, maintenance expenses, and other impacts of this project are borne by the project and not by private property owners such as the Greenway. (0257, 0268-M –3)

Public Comment: In conclusion, we would like to make it clear that the Dulles Greenway will cooperate in a businesslike manner with WMATA and the DRPT in negotiating a detailed agreement that would address these impacts, but will expect to have all impacts of the project on the greenway addressed and dealt with by the project sponsors. (0257,0257-T –10)

Public Comment: The greenway sent its position statement to WMATA in early June so that everyone involved with the sponsorship and promotion of this project would understand that the greenway had serious concerns. We requested and had a separate meeting several weeks ago at which we further discussed these concerns. We want to reiterate that the greenway's cooperation over and above the existing median cannot be taken for granted. (0257, 0257-T –3)

Public Comment: First, the negotiation and completion of a comprehensive agreement between the Greenway and the project's sponsors, whether WMATA, Department of Rail and Public Transit or others, to cover such things, as redesigning this project to eliminate or eliminate or reduce the impacts of the greenway outside of the existing median. In a nutshell, make it work within the existing median. (0257, 0257-T –4)

Public Comment: The agreement should address detailed construction standards and mitigation measures to ensure that construction is performed at night, off peak hour, and in a way that will minimize the impact on the Greenway's customers. (0257, 0257-T –6)

> ***Response:*** *The Comprehensive Agreement between TRIP II and the State Commission of the Commonwealth of Virginia requires that TRIP II dedicate the median of the Dulles Greenway to rail. As stated by the Project Team in a separate meeting referenced above, this dedication of the median of the Dulles Greenway has attendant effects, some of which TRIP II must bear. These effects will be considered as the DRPT continues its coordination with TRIP II on the LPA's overall effects to this private Toll Road and on the development of a comprehensive agreement for the Metrorail Extension to Route 772. The Project Team can clearly respond that the Project cannot be solely within the existing median and therefore will require the relocation of Greenway lanes at the Route 772 Station, Route 606 Station, and the junction of the revenue tracks with the yard lead tracks.*
>
> *During the construction of the Metrorail Extension, it would be necessary to permanently relocate the lanes on the Dulles Greenway around the Route 606 and Route 772 stations and around the yard leads for the Metrorail Service and Inspection Yard. DRPT and its technical manager, WMATA, will coordinate with TRIP II on the application of best management practices to minimize the disruption of traffic. These practices would be modeled after TRIP II's recent experience during the widening of the Dulles Greenway from four to six lanes. With respect to construction of the Metrorail line, yard leads, and stations in the median of the Greenway, again best management practices would be used for construction methods, access, haul routes, etc., to minimize disruption of traffic. Installation of the three pedestrian bridges over the Dulles Greenway will have minimal impacts, because any lane closures will be during the off-peak hours, when traffic volumes are lowest.*

Compliance with Americans with Disabilities Act

Public Comment: I do appreciate the informative open house that you held. I understand that ADA specifications will be followed to enable access for persons with disabilities under the current ADA requirements. (0259, 0259-T –1)

Public Comment: We need to make sure that the intermodal -- that there is an intermodal transportation system that is accessible for persons with disabilities, its facilities and its vehicles, and that para-transit is provided throughout the corridor, including Loudoun County, and that needs to be taken into account. (0157, 0157-T –4)

Response : *All of the facilities and vehicles of the Metrorail Extension fully comply with the ADA Accessibility Guidelines.*

Public Comment: We also would like to request that you include persons with disabilities at the table when you are making these transit decisions. (0259, 0259-T –5)

Response: *The selection and revision of the Locally Preferred Alternative was made by the Commonwealth Transportation Board and the WMATA Board of Directors. Public input on the alternatives considered and selected was obtained throughout the length of the study process at the Public Scoping Meetings (July 2000), Public Information Meetings (January 2001), the Public Hearings for the Draft EIS (July 2002), and the Public Hearings for the Supplemental Draft EIS (December 2003) as well as many meetings held with community groups, civic associations, stakeholders, businesses, and public agencies. All of these meetings were open to the general public, including members of the public with disabilities. In addition, the facilities and vehicles of the Metrorail Extension fully comply with the ADA Accessibility Guidelines.*

Public Comment: And lastly, Madam Chair, persons with disabilities need to be a part of the process, and they need to be consulted in the design of this process. We stand ready to help you with this and we look forward to providing written comment, but we want to be assured that accessible formats are going to be available. They were not available here tonight, and we only have until August 28th, and I understand that accessible formats might not be readily available at this time. (0157, 0157-T –5)

Response: *In response to this comment at a public hearing on the Draft EIS in July 2002, the Project Team contacted the commenter after learning that the presentation materials were needed in an alternate format. The information requested was mailed to the commenter in several formats and additional help for answering questions was also offered.*

Freedom of Information Act Requests

Public Comment: We request that information collected by the study be available on demand to any interested member of the general public, as if the study were governed by the Freedom of Information Act. (0162, 0162-M –19)

Public Comment: We request that information collected by the study be available pursuant to the Freedom of Information Act. (0184, 0184-T –16)

Response: *DRPT has responded to requests for information under the Virginia Freedom of Information Act. WMATA has responded to requests for information under its Public Access to Records Policy. The Project Team does not administer or respond to requests under the federal Freedom of Information Act. Such requests should be made to the Federal Transit Administration. To view information collected by the study team or obtain copies (for the price of the copies), contact the INFO Line at 888-566-7245.*

Quality of Work

Public Comment: The first thing I'd like to do is thank our leadership here for bringing us to this point. Win, lose or draw, it's been a horrendous task, and I for one appreciate it. (0156, 0156-T –1)

Public Comment: The Sierra Club will be submitting more extensive written comments, but I will conclude by saying we are encouraged by the quality of the work we have seen so far on this project and the professionalism of the various parties involved. We look forward to continuing to work for completion of rail in the Dulles corridor. (0158, 0223-M –6)

Public Comment: I wish to express my thanks for the great presentation this afternoon to Centennial Contractors' staff about the Dulles Corridor Rapid Transit Project. You obviously were well prepared and knew the project intimately. The information you provided was well received and answered many

questions about the impact to Tysons Corner. Every person who attended have provided me positive feedback about the presentation. I hope our feedback was also of benefit. Your efforts are evidence of WMATA's commitment to customer service and your professionalism. Thanks again. (0292, 0292-L –1)

Public Comment: Thank you for once again pointing out by planning such ugly commercial facilities for our property that times have changed and a new development pattern needs to be implemented if we are going to maximize the public benefit from the Dulles Corridor Rapid Transit Project. (0464, 0464-L –7)

Public Comment: On behalf of the Claude Moore Charitable Foundation (CMCF) Trustees, the owners of 600+- acres in Loudoun County, Virginia west of the Dulles Greenway and north of the Loudoun County Parkway, we wish to summarize the comments with regards to the Draft Environmental Impact Statement in the vicinity of the Moorefield Station project. We have appreciated the time provided by your staff and WMATA to provide us overview of the DEIS process in the context of our on-going rezoning application with Loudoun County (ZMAP 2001-0003) for mixed use development at the planned transit node at the Route 772 interchange. (0451, 0451-L –1)

Public Comment: I would like to first say that I think while there have been a -- there is a lot of criticism of the EIS process, I think there is a tremendous amount of good work here, and people have worked very, very hard to make it available to the public, and I commend everyone who is involved for what they have done. If you really cared to track it, you could track it all along the review process. (088, 0172-T –1)

Public Comment: All things considered, though, I think this has been a very positive process, and I would urge the, where we have some questions to answer, let's answer them, but let's get on with the work. Let's build a rail system to Dulles and Loudoun County. (088, 0172-T –11)

Public Comment: I want to start by thanking the panel for indulging me at the last two public hearings for the last two evenings, and I will be brief tonight. But I also want to take a moment to thank you for the very professional manner in which these hearings have been conducted, the support that you have given to the public to understand what the questions are before us, the accommodations, aside from the air conditioning last evening, which no one had planned on. We have had, I think, a very successful series of hearings. Again, my thanks and my compliments to you for that. (0131, 0239-T –1)

Public Comment: I am very pleased with the preliminary design alternatives as shown in the draft Environmental Impact Statement and attachments, and commend those who have contributed to the design effort thus far. (0194, 0194-T –1) (0194, 0216-M –1)

Public Comment: This was great. You have done a wonderful job. Thank you for your time and efforts on behalf of Fairfax County Residents, like myself. (0032, 0032-CC-1)

Public Comment: Excellent exhibit area. (0042, 0042-CC-1)

Response: *Comments noted.*

Public Comment: We request that if the selection of the Locally Preferred Alternative is rail, that this choice be placed on the ballot. For example, we could ask the voters in Fairfax and Loudoun if they wish a permanent 5% property tax surcharge and double the rate on the Access Road in exchange for rail rather than BRT. The largest public works project in history for this area deserves a real up and down popular vote. As a comparison, Seattle is asking its voters to approve a much less expensive project than Amtrak to Dulles, their monorail extension, and is being honest about the cost by coupling a dedicated tax with it as part of the referendum. (0162, 0162-M –23)

Public Comment: We request that money spent beyond this point be done pursuant to the provisions of the Virginia Public Procurement Act, so that we know that all transactions are being done in the open and subject to a competitive process. (0162, 0162-M –21)

Public Comment: We request Public Procurement Act status for this. And we think if the Locally

Preferred Alternative is to be rail, that this be placed on the ballot, as Seattle is doing for a less expensive project, along with a dedicated tax. (0184, 0184-T –19)

> ***Response:*** *All work on the project is subject to procurement procedures of Federal Transit Administration and the Commonwealth of Virginia, including its Public-Private Transportation Act of 1995.*

Public Comment: I need three documents: 1. Page 45 of 67 on Acquisition List; 2. GPN-R-046, Sheet No. 059; and 3.) GPN-A-219-TW, Sheet No. 766 (0044, 0044-CC-1)

> ***Response:*** *The Project Team responded to this request.*

Concerns Regarding the Public Review Period

Public Comment: Additional time needs to be extended for more adequate review of the report. (0150, 0150-T –8)

Public Comment; Comment period should be extended to a true 45-day period. Public meetings in July were the first meaningful public notice of the availability of the Final EIS. (0510 11-1)

Public Comment: Unfortunately, the citizens directly impacted by this potential project have had less than one month to review the thousands of pages of documents that were almost inaccessible. I still haven't been able to read the noise technical report. You told us at a meeting in McLean that you couldn't figure out how to put the EIS documents on the web. If you can't figure that out, how are you going to build this project? (0145, 0145-T –2)

Public Comment: My biggest worry is that we are rushing to get this study through without giving enough time for the community to critically review and to analyze this important document. (0147, 0177-T –5)

Public Comment: First, I believe that this hearing should be continued to a later time, say September or October, because of the short amount of time given most of us to analyze the information presented in the massive documents comprising the draft EIS. (0203, 0203-L –1)

Public Comment: The Hunter Mill Defense League will submit a report prior to the August deadline. Although the Hunter Mill Defense League appreciates the extension of the comment period to August the 28th, we still remain concerned that many citizens will not have sufficient time to review the extensive and complicated EIS reports. (0147, 0177-T –1)

Public Comment: We ask that the review period be extended into the fall. We would like the ability to have our comments be more substantive. It would be nice to have this project gather support based on knowledge rather than the result becoming yet another project to remedy its disruption. The time limitation on review of this project is unofficial. There is time to review and comment on it in depth and respond to community concerns. (0179, 1079-T-11)

Public Comment: While I support the expansion of rail to Dulles, I have a number of concerns. The massive DEIS report, after being delayed six to eight months, was only made available to the public in late June, early July. It is cost-prohibitive to obtain a copy and simply viewing it at one of the locations is impractical and unrealistic. There has been insufficient time to review and absorb the vast amount of information presented, particularly with the project of this magnitude that will affect our entire region for years to come. (0150, 0150-T –1)

Public Comment: I am concerned that the public review of the draft EIS has been shortchanged. The late June release of the EIS is the first time that there has been a wide advertisement of the recommended proposals, but with limited access to the report. Many communities have asked that these

hearings be postponed into the fall in order to give us time we need to adequately review the data. This is an extremely complicated report. These requests have been ignored. (0179, 0179-T –2)

Public Comment: Until the release of this report, the information was held close to the chest when we approached officials and consultants regarding the details of the contents. To have limited availability of this report at libraries with static hour for two summer months when many residents are on vacation and only two weeks before holding public hearings does not constitute wide distribution into the general public nor adequate time to discuss this EIS. (0179, 0179-T –3)

Public Comment: The incredibly short period of thirty days to digest and respond to this study provides just another obstacle to surfacing the concerns of people who live along the roadway. Rather than provide material on the web, only hard copies were made available at libraries. (0087, 0087-L –11)

Public Comment: The incredibly short period of thirty days to digest and respond to this study provides just another obstacle to surfacing the concerns of people who live along the roadway. Rather than provide material on the web, only hard copies were made available at libraries. Is it any wonder that the sincerity of this study is in question? (0087, 0227-E –9)

Public Comment: THE PROCESS FAILED TO PROVIDE ADEQUATE TIME FOR LOCAL REVIEW: After issuing so many calls for more time, we find there has NOT been adequate time to convene meetings of interested parties and groups. Efforts to obtain approvals of boards of directors of community organizations have been almost impossible. Numerous civic and business groups have asked for but have been refused more time, including the Hallcrest Heights Homeowners Association, the Hunter Mill Defense League, and MoveIt.org. By our count, there have been only 54 days during which the EIS has been available, and then only under circumstances that made it extremely difficult for working people to view the material. In contrast, other project managers such as Maryland's Department of Transportation recently granted stakeholders an extension of the comment deadline on the Corridor Cities Transitway proposal, which also is looking at either BRT or rail in the upper I-270 area. The MDOT also provided free CD-ROMs of Parts I and II of their EIS. That process builds local support and understanding. We call again today on WMATA and VDRPT to grant an extension of the comment period. (0138, 0476-L –2)

Public Comment: The general public was not given a fair opportunity to review the data presented in the DEIS. Distribution of the information during the summer tends to indicate community input was to be limited. Was this process put in place to discourage effective public participation? We feel that the process did not consider us to be active stakeholders in making decisions. The timing of the material distribution and the volume of material did not empower us to participate in the decision making process. (0147, 0459-L –2)

Public Comment: The comment period must be reopened, to Sept. 30 or later. I would argue that the Project Team only really gave the public 30 days to comment, instead of the federally required 45 days. While the notice of availability of the EIS was issued June 28, the public did not get a real chance to review the documents and alignments until the July 29-31 public hearings. Furthermore, the Project Team forced the public to purchase the most essential documents, such as Parts I and II on CD-ROM for $10 each and forced the public to purchase the technical documentation for as much as $875 for a complete set. (See Exhibit 7). In contrast, in Maryland DOT's "Corridor Cities Transitway" DEIS, the hearings were held a full 45 days before the Aug. 16 comment deadline, and MDOT has since allowed comments to trickle in after Aug. 16. MDOT provided Parts I and II of their EIS on CD-ROM and handled those out for free. The Dulles Project Team went out of its way to make it as difficult as possible for average members of the public to review the technical documents. Its release of the documents in the dead of summer for a project that will cost nearly three times the cost of the Corridor Cities project in Maryland is a violation of the spirit of the National Environmental Policy Act. (0112, 0462-L –48)

Public Comment: How can you say you're giving a 45-day deadline for comments when the notices for the meetings and EIS review arrived in late July? Why not extend the deadline til September 15 or September 30? (0112, 0382-L –1)

Response: *The time made available to review the Draft EIS was 60 days, which exceeds the 45 days required under the Federal Transit Administration and USDOT regulations implementing the National Environmental Policy Act (NEPA). Following publication of notices in the Washington Post, regional newspapers, the project website, and project newsletter on June 27, 2002, the Draft EIS was made available in the following locations: libraries and community centers located throughout Fairfax and Loudoun counties, the project outreach center in Reston, at the project office in Rosslyn, WMATA's headquarters, VDOT's Northern Virginia Office, DRPT's Northern Virginia Office, and by request (for the cost of the copies or CD). The public comment period closed at 5:00 p.m. on August 28, 2002.*

In addition, as required by NEPA and its implementing regulations, a Notice of Availability was published on July 12, 2002 in the Federal Register. As required, the publication was at least 45 days prior to the close of the public comment period.

Public Hearings on the Draft EIS were held during the formal public comment period to provide the public with an opportunity to consult with project staff, learn more about the studies conducted, and provide comments at a public meeting.

It is standard practice to make documents available at public libraries, public offices, and at locations such as project offices and information centers. Copies of the Draft EIS, General Plans and Technical Reports were made available for review at no charge in multiple public places throughout the comment period. As a convenience, copies of the documents cited were also offered to the general public for the cost of producing the documents.

The Supplemental Draft EIS and Final EIS have been placed on the project's web site.

Accessibility of Project Information

Public Comment: We are quite disappointed that in all the years the county had to put this report together, by its own admission there was not enough time to figure out a way to place the data on the web for us to access at times when it is convenient to us, when we will be paying costs for this extension. As Delegate Plum has indicated, if we have waited 25 years for this report, another two-month extension to get it right will be a mere blip on the radar screen. (0179, 0179-T –4)

Response: *The time made available to review the Draft EIS was 60 days, which exceeded the 45 days required under the Federal Transit Administration and the USDOT regulations implementing the National Environmental Policy Act. The Draft EIS was available at more than 20 libraries and community centers located throughout Fairfax and Loudoun counties, the project outreach center in Reston, at the project office in Rosslyn, WMATA's headquarters, VDOT's Northern Virginia Offices, DRPT's Northern Virginia Offices, and by request (for the cost of the copies or CD).*

Public Comment: Why is your address in Arlington since this is NOT involved with that county, so far as I can determine? (0006, 0236-L –4)

Response: *During the NEPA phase, the project office for the Dulles Corridor Rapid Transit Project were located in Arlington (Rosslyn). This location was selected based on its proximity to a Metrorail stop, WMATA's headquarters, and because of the desire to have the offices for the Project in the Commonwealth of Virginia. For the preliminary engineering phase, DRPT has established a new project office in Tysons Corner.*

B. Supplemental Draft EIS Comments

Local Agency Comments

Need for Adequate Public Participation

Local Comment: …while it is very useful to consider alternatives that the public needs to be part of this processes, too. It shouldn't be left relegated solely to land owners and I trust that we will in some fashion be consulted if there's any further development of other alternatives. (0034 11-1)

> ***Response:*** *The McLean Citizens Association was invited and participated in the May 2004 post-hearing conference on the Tysons West Station entrance and facilities.*

Public Comments

Concerns Regarding Project Refinements Since the DEIS

Public Comment: Your reply to my statement ignores the fact that the project was broken into two phases AFTER the decision was made to divert the rail THROUGH Tysons Corner with 4 stops. That decision substantially boosted the cost of the entire project (which you also fail to recognize), forcing it to be broken into two phases and seriously jeopardizing the remaining unfinished leg. If all federal, state and local funds are used up through engineering and construction of the first half (West Falls Church through Tysons Corner to Wiehle), there is NO GUARANTEE that the second half will ever be finished.
Why would you ask for comment, if you are not prepared to reconsider some of the earlier erroneous decisions? The "locally preferred alternative" you cite obviously is not cost effective and is undermining the entire project. The decision makers in this process NEED to be asking whether or not the diversion of the track from the toll road median strip through Tysons Corner makes sense - economically or otherwise. There is an obvious immediate need for rapid mass transit (i.e. rail) from Dulles airport all the way to the District - not just from the District to Wiehle Ave. Please reconsider the decision to divert the track from the median strip through Tysons Corner. If you don't know the cost for engineering and construction to perform the loop through Tysons Corner, then forget it. It is much easier for the Tysons Corner business interests to run buses to stops on the Dulles Toll Road median strip, than for people from Dulles airport and all over western Fairfax and Loudoun Counties to have to take the buses to an interim rail-head. (0082 11-1)

> ***Response:*** *The purpose of the Supplemental Draft EIS is to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS Public Hearings Report. A number of alternatives, including various Tysons Corner alignments, were evaluated in detail in the June 2002 Draft EIS and Section 4(f) Evaluation. Additional information on the alternatives considered, and the screening process used to evaluate the alternatives is included in the Final Alternatives Analysis Report (May 2001).*

Coordinate Plans with WEST*GROUP Master Plans at Tyson's East

Public Comment: WEST*GROUP has contracted a major national design firm to do a schematic master plan of the entire area around Tysons East. As soon as FFGA is consummated, we will be filing rezoning applications, annual plan review nominations to implement the "with rail" aspects of the Tysons Plan. It is imperative that the final Tysons East Station plan and its appurtences by carefully coordinated and integrated with WEST*GROUP's master plan. As a dedicator of right of way, rail facilities and a 25% economic stakeholder in the funding of rail, we feel our input demands recognition and we are willing to work with the designers and constructors of rail to come up with the best possible public private plan of the Tysons East Station as well as the balance of the project and look forward to more dialogue as the rail project goes forward. (0123 0158-28)

> ***Response:*** *DRPT and WMATA look forward to ongoing coordination with WEST*GROUP and other stakeholders in order to ensure that the Tysons East Station best meets the needs of all parties involved.*

Need More and Continuing Public Involvement

Public Comment: The public has consistently and dangerously been short-changed and refused meaningful evaluation and input into the nation's biggest mass-transit proposal. This must change going forward. We need, I respectfully submit and must insist, on public participation throughout by frequent public meetings, by a public task force, et cetera. (0068 0076-1)

> ***Response:*** *Public outreach during the circulation of the Draft EIS and Supplemental Draft EIS was conducted in accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, and with the WMATA Compact requirements. Public Hearings were held during the formal public comment period for both the Draft EIS and Supplemental Draft EIS to provide the public with an opportunity to consult with project staff, learn more about the studies conducted, and provide comments in a public forum. In addition to these public hearings, DRPT and WMATA had presentations to various community groups and stakeholders during the public comment period. Please see Chapter 11 of the Final EIS for a summary of these hearings and meetings. The Project Team invites members of the public to call the INFO line (1-800-566-7245) or email (dullescorridor@aol.com) at any time to schedule additional meetings or to ask project related questions.*

Public Comment: There be continued dialogue between the engineering design team and adjacent communities throughout the final design process on project impacts and mitigation. (0026 0027-15)

> ***Response:*** *DRPT and WMATA have analyzed and documented reasonable alternatives that would avoid or reduce adverse impacts. Overall, the impacts of the LPA are anticipated to be minor, especially given the project's length and complexity. In response to comments in the public hearing record, DRPT and WMATA are recommending mitigation measures that are detailed in the Final EIS. Moreover, DRPT will maintain thorough and continuous communication among all public and private stakeholders throughout the implementation of the project in order to minimize impacts and implement the mitigation commitments in the Record of Decision.*

Public Comment: In closing, I urge the relevant agencies and political officials to open this process up to the affected communities, rather than only hold a public forum when federal or state law requires that it be done. To date, there has been far too little community input into such a large project that would have such a disproportionate impact on residents, drivers, transit users and taxpayers. (0068 0173-39)

> ***Response****: As documented in Chapter 11 of Final EIS, the Project Team has conducted a comprehensive public involvement program. A variety of methods were used to encourage citizens to participate in the project since initiation of the Dulles Corridor Rapid Transit Project, including: public meetings, project displays at shopping centers and fairs, project documents at libraries and community centers, and print, radio, and electronic media, project newsletters and updates, and stakeholder meetings with private citizens, community groups, civic associations, and businesses. In addition, prior to public hearings of the Draft EIS and Supplemental Draft EIS, all residents and property owners within 500 feet of the proposed improvements were notified about the hearings.*

Need More Information

Public Comment: There doesn't seem to be any user friendly way to get any specific information or people who have any idea of what you are talking about. (0003 0003-2)

> ***Response****: All Project documents have been made available at libraries and community centers throughout Fairfax and Loudoun counties, at the project office in Rosslyn, at WMATA's headquarters, and at VDOT's Northern Virginia Office. Information can also be found on the project website: www.dullestransit.com or by calling the Project INFO Line at 1-800-566-7245.*

Appreciate the Public Outreach Provided

Public Comment: Thank you very much for your attention and I do appreciate the meetings, the briefings and the field trips that we have been accorded and that is much appreciated. (0036 0062-6)

Public Comment: I would like to thank Ick Thong, Neil Nott, and other members of the WMATA & VA Dept. of Rail and Public Transportation teams for their eagerness to work with our firm and all the parties involved in this process. This public-private partnership will greatly benefit the process. I would also like to thank the Transportation and Planning Offices of Fairfax and Loudoun Counties, and Airport's Authority for their work to help solidify this much needed project. (0052 0053-2)

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in selecting the LPA.*

Pleased with Noise and Visual Impact Mitigation at WFC Rail Yard

Public Comment: Our community is pleased with the track enclosure at the WFC rail yard and lower Metrorail alignment proposed to mitigate noise and visual impacts. Thank you for hearing us. (0026 0027-1)

Public Comment: Our community is pleased with the proposals to cover the tracks at the West Falls Church (WFC) rail yard and the lower profile of the Metrorail alignment. Thank you for hearing us. (0087 0102-1) (0089 0104-1) (0099 0115-1) (0104 0121-1)

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in selecting the LPA.*

Would like to participate in Upcoming Hearing or Other Activities

Public Comment: I think it's egregious to require me to type up a letter and put it in an envelope and mail it in order to arrange time to testify at the Dec. 11 hearing! In this day and age, a simple phone call or email should work and I request that you sign me up to speak at the Dec. 11 hearing in ashburn. (0016 0017-1)

Public Comment: We respectfully request that, going forward, we be involved in a significant and meaningful way in the planning for a project that has the potential for a significant positive - or negative - impact on the community in which we live. (0039 0040-11)

> ***Response:*** *As part of its procedures, WMATA requested that all parties wishing to speak at the Project's hearings formally do so in writing, in order to have a record of the registration to speak.*
>
> *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA in March and April 2004.*
>
> *As the NEPA process ends and the preliminary engineering starts, DRPT, the project sponsor, will continue an active community outreach program.*

11.2 Agency Coordination

A. Draft EIS Comments

Federal Agency Comments

Federal Aviation Administration Involvement

Federal Comment: If it is determined through the EIS process that this site meets your operational needs and receives environmental approval, land will have to be acquired from the airport. The land on which Site 15 is located is dedicated airport property. The Metropolitan Washington Airports Authority (the Authority) is required to seek FAA approval for the release of any property dedicated for airport purposes as identified on the Exhibit "A" Property Map for the airport. Also, under the **Federal Revenue Diversion Policy,** FAA will be required to publish the intent to release this property in the Federal Register for 30 days to solicit public comments. The Authority would be required to obtain the fair market value in compensation for the property. (0485, 0485 – A –2)

> ***Response:*** *As indicated in Section 3.3 of the Final EIS, the Project Team recognizes the process that it will have to follow for the Project's use of Airport property for the Metrorail S&I Yard. The costs for the acquisition of the necessary property interest for the S&I Yard at fair market value was factored into the capital cost estimate presented in Chapter 8 of the Final EIS.*

Federal Comment: In order for FAA to write a favorable Record of Decision (ROD) for the project, first FTA must issue their ROD. MWAA must show the project on their Airport Layout Plan and obtain FAA approval. (0485 11-1)

> ***Response:*** *Comment noted. FAA role and responsibility is described in Section 1.3 of the Final EIS. The LPA is included in the Airport Layout Plan approved by FAA in March 2004.*

State Agency Comments

Consideration of Public Input

State Comment: I am a strong supporter of public transit for Northern Virginia, including the Dulles Corridor Rapid Transit Project. I also think a major project such as this one requires the serious consideration of citizens' concerns. (0012, 0012-A –1)

> ***Response:*** *All comments received during the public hearings on the Draft EIS and proposed General Plans and on the Supplemental Draft EIS and revised General Plans were considered in the selection and revision of the Locally Preferred Alternative by WMATA's Board of Directors and the Commonwealth Transportation Board. Before and after the hearings and between the hearings there have been extensive public involvement activities.*
>
> *The Final EIS is being circulated to inform decision-makers and the public on the selection of the Metrorail extension as the LPA and on the potential consequences of implementing the proposed extension in the corridor. Overall, the potential adverse impacts of the extension on the human and natural environment are expected to be minor given the extent of the extension project. Coordination with the public, stakeholders, resource agencies, and local governments has confirmed these findings.*

Regional Agency Comments

Disruption of Airport Operations

Regional Comment: Extensive continuing coordination is needed between the DCRTP design team and the Airports Authority throughout project design and construction to avoid potential conflicts between DCRTP and future IAD projects, and to minimize disruption during construction. (0440, 0440-A –10)

> ***Response:*** *The Project Team and the MWAA staff have had continuing coordination meetings throughout the environmental review phase of the project. These meetings were also used as a forum to discuss project proposals relative to alignment, stations, and other facilities. The meetings were also used to investigate and resolve potential conflicts between the proposed Metrorail facilities and proposed MWAA projects. The preliminary engineering phase will continue the coordination meetings to maintain the existing working relationships and information exchange.*

Local Agency Comments

Coordination with Local Entities

Local Comment: Our overall concern is coordination. The County and VDRPT must actively coordinate land use and road planning with the planning and construction of rail. RA will be happy to assist in that continuing coordination. The recommendations of Supervisor Hudgins' 3-day charette are important to good development and to mitigating the effects on our community. (0233, 0426-M –3)

> ***Response:*** *The Project Team has been actively coordinating with VDOT, Fairfax County, Loudoun County, and other state and local agencies since the project's initiation. Please see Chapter 11 of the Final EIS for a summary of the Project Team's coordination activities since the Notice of Intent was published on June 26, 2000. VDOT, Fairfax County, and Loudoun County have had the opportunity to review and submit comments on the Draft EIS and Supplemental Draft EIS. DRPT, the project sponsor, will continue the coordination through preliminary engineering, final design, and construction of the Wiehle Avenue Extension.*

Local Comment: Although supportive of the project, the City [of Falls Church] has some critical issues with regard to the EIS which we feel must be addressed before the project proceeds. Generally we are concerned that although the city of Falls Church will be impacted by the project, our community overall has been overlooked in the EIS. (0122, 0164-T –1)

Local Comment: The [Falls Church] city council and I would appreciate your careful review and attention to these issues on behalf of all our citizens. (0122, 0164-T –12)

Local Comment: The impact area of the project includes the East and West Falls Church metro stations which are located on the perimeter of our city limits. We believe that the impact to the citizens and the environment of the City of Falls Church has neither been assessed nor mitigation measures considered or developed. (0122, 0164-T –2)

Local Comment: The project, while appearing to be beneficial to the region, has a significant and direct negative impact on the City [of Falls Church] in a manner not fully analyzed in the draft EIS. We have previously asked that this impact be thoroughly studied. However, we have now concluded that it has not been given full consideration. Overall, we strongly believe the draft EIS' lack of full analysis could prove disastrous for the City [of Falls Church], the surrounding neighborhoods and our educational structures. (0122, 0164-T –9)

> ***Response:*** *The Draft, Supplemental Draft, and Final EIS fully document the potential significant effects of the No-Build and Build Alternatives. The Project Team initiated meetings with the City of Falls Church during the course of the NEPA process to more fully understand the concerns*

and position of the City as it relates to the project. Issues ranged from parking problems at and near the existing Metro Stations to the perceived and actual noise levels at the West Falls Church Service and Inspection Yard.

Implementation of the LPA would result in increased off-peak service frequencies for eastbound trains at the East Falls Church Station. However, operating plans for the Wiehle Avenue Extension and Full LPA assume no additional feeder bus service, nor any new parking for the off-peak period for this station. Because the station's existing park-and-ride facilities are typically full by 8:00 AM on most weekdays and parking is controlled on local streets, it is not anticipated that increased off-peak Metrorail frequencies would generate additional traffic in and around the East Falls Church Metrorail Station. While the Project Team does anticipate other effects, as there would be no change from existing conditions, additional meetings with the City of Falls Church were held to discuss the issues of overflow parking and cut-through traffic due to the selected LPA, the Metrorail Extension.

Local Comment: In its resolution, the Board specifically cited four matters that need special attention by the Project Team and deserve continuing coordination with the County during the preparation of the Final EIS:

- Noise mitigation at the West Falls Church rail yard and along the Dulles Connector Road.
- Design of the intermodal bus transfer facility at the Tysons Central D Station between the two regional shopping malls.
- Mitigating the traffic impact of the 2,000 space proposed parking structure at the Tysons West Metrorail Station, including consideration of reducing the amount of parking provided at this station, or elimination or relocation of parking if no acceptable mitigation strategy is found.
- Details involved in the operational enhancement of existing express bus services operating in the Dulles Corridor. (0490 11-1)

Response: *For noise mitigation, the Project will enclose a portion of the loop track at the yard's eastern end and the new yard lead in box structures. These noise mitigation measures will reduce the wheel squeal noise of the train movements within the Yard.*

The Project Team has developed a site plan for the bus facilities at Tysons Central 123 Station that is acceptable to the stakeholders and Fairfax County.

The Project Team has reduced the capacity of the park-and-ride structure at Tysons West Station from 2,000 to 500 spaces and proposes that the 500 spaces be incorporated into the redevelopment of parcels in the vicinity of the station.

DRPT will coordinate with Fairfax and Loudoun counties on the enhancement of the Corridor express bus service.

Public Comments

Coordination with Local Entities

Public Comment: Close coordination among VDRPT, WMATA, VDOT and local planning officials is absolutely essential to ensure that the feeder bus system works effectively. Local elected officials bear the primary responsibility in being proactive in ensuring that this close coordination exists. (0088, 0211-M –12)

Public Comment: The history of transit development is in this region and elsewhere proves that a business-as-usual approach will result in enormous missed opportunities. Only if all leaders in the corridor develop a coordinated plan, an effective set of implementation programs, and a viable funding mechanism, will we be able to realize the full potential of Dulles rail. (0478, 0484-E –13)

Public Comment: We strongly urge VDRPT, WMATA and VDOT to work closely with Loudoun County planning officials to give a comprehensive review to the overall parking and access questions related to both transit stations in Loudoun County. (0204, 0204-M –13) (0088, 0211-M –16)

Public Comment: We request that Fairfax County's Dept. of Transportation review the results of the Draft EIS and report their analysis of the least-cost and most cost-effective transit mix in the Dulles Corridor prior to any selection of the Locally Preferred Alternative. (0162, 0162-M –14)

Public Comment: Our overall concern is coordination. We are directing our comments to the Dulles Corridor Rapid Transit Project Team, but both the Fairfax County Government and the Virginia Department of Transportation must actively coordinate land use and roads with planning and construction of Metrorail. The Reston Association will be happy to assist in that continuing coordination. (0210, 0210-M –2) (0170, 0170-T –2)

Public Comment: We request that the Fairfax County Department of Transportation review the results of the draft EIS and report on their analysis of the least-cost and most cost-effective transit mix in the Dulles corridor. (0184, 0184-T –11)

Public Comment: Need for early coordination among government entities to "calm" potentially dangerous cut-through traffic. (0432, 0432-E –3)

> ***Response:*** *The Project Team has been actively coordinating with VDOT, Fairfax County, Loudoun County, and other state and local agencies since the project's initiation. Please see Chapter 11 of the Final EIS for a summary of the Project Team's coordination activities since the Notice of Intent to prepare and EIS was published on June 26, 2000. VDOT, Fairfax County, and Loudoun County have had the opportunity to review and submit comments on the Draft EIS and Supplemental Draft EIS. DRPT, the project sponsor, will continue the coordination through preliminary engineering, final design, and construction of the Wiehle Avenue Extension.*

Public Comment: Probably the most significant thing, I think local officials must in this case be more proactive than they were either able to be or at least than they ultimately were with respect to designing the urban center of Tysons Corner or the station such as Nutley and Dunn Loring and Huntington and others. (088, 0172-T –9)

Public Comment: Local officials must take a more proactive approach to urban design considerations and the planning of internal circulation systems associated with the very urban development anticipated within transit station impact areas. Reacting to private sector proposals is not sufficient. It is already apparent that at several of the transit stations, especially the Reston Town Center and Route 772 stations, exclusive busways, light rail systems, or similar methods must supplement a greatly improved pedestrian circulation system in order for these important activity centers to function effectively. (0204, 0204-M –14)

> ***Response:*** *The Project Team forwarded the Public Hearings Report to Fairfax and Loudoun Counties and the Town of Herndon, which had the opportunity to review the above comments.*
>
> *Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for mixed-use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP. The Supervisor and her committee will conduct special meetings for the community, property owners, and developers to discuss the RFP process, status, and developments to ensure all concerns and issues are identified and addressed accordingly.*

Public Comment: Designate a managing entity to coordinate implementation of the mitigation plan and ensure compliance and reports to stakeholders. In the mitigation plan, designate the specific responsibilities of each agency, along with cost share, timeline, and monitoring. (0388 11-1)

Public Comment: Would like the Project Team to develop a joint mitigation plan that would involve all affected communities. (0388 11-2)

> ***Response:*** *DRPT, the project sponsor, will prepare, implement and monitor a mitigation plan, based on the mitigation commitments and in the FTA Record of Decision.*

B. Supplemental Draft EIS Comments

Federal Agency Comments

Transit-Oriented Development

Federal Comment: The Public Hearings Report indicates that the Project Team will work with local governments to support and implement the Fairfax County and Loudoun County comprehensive plans, which contain guidelines to support transit, higher densities, mixed-use development, and pedestrian and bicycle friendly fostering transit-oriented development along the Dulles Corridor in order to ensure that future transit ridership is maximized. The comment responses contained in the Public Hearings Report show that the Project Team has been adequately responsive to our concerns regarding implementation of supportive station area transit-oriented development as part of the project.(0141 11-1)

> ***Response:*** *The Project Team will continue to coordinate with various agencies to ensure that station area transit-oriented development is implemented to best serve the needs of the Dulles Corridor and region.*

Federal Comment: Concerning FAA's issuance of a Decision for the Environmental Impact Statement.

We understand that Phase 1 of the project would provide rail access to a station at Wiehle Avenue with Executive Bus Service providing access from that station to the airport terminal. This phase also provides for an expansion of the Dulles North Transit Center primarily to provide parking for increased ridership over the existing bus service to points east and to Washington, D.C. Phase 2 of the project would extend the rail service to the airport and construct the rail service yard. Subject to satisfactory completion of the EIS, and after the Federal Transit Administration issues their Record of Decision, we would anticipate issuing an FAA Decision on the entire ultimate project.

Concerning the release of the Dulles Access Highway right-of-way for the Rapid Transit Project:

We believe that the Metropolitan Washington Airports Authority (the Authority), which operates the airport under a lease agreement from the United States of America, can provide a right-of-way on airport property, specifically along and within the median of the Dulles Airport Access Highway, provided that it provides a means for passengers to access the airport. Our office would have to review and approve the proposed Right of Way agreement before it is executed by the Authority. However, our office cannot authorize a "fee simple" release of this Right of Way or of any airport property. We can only concur with the Authority releasing their interest in the land for the remaining life of their lease. We believe that release of a "fee simple" interest in the property would require approval action at the U.S. Department of Transportation level or possibly higher.

Furthermore, we believe that the Authority can release its interest in the Right of Way at no cost to the rail operating authority, provided the rail system accesses and benefits the airport. Executive bus service from the proposed Wiehle Avenue station to the airport would be considered as providing airport access for the purposes of this no-cost land interest transfer. However, if passenger service is not provided from the rail station to the airport then the Authority's interest in the land could not be conveyed at no-cost, and the rail authority would have to pay the fair market value for the land interest.

Concerning the release of airport property for a rail maintenance yard.

While we can concur with the Authority's release of its interest in airport property for the rail maintenance yard, the Authority must receive the fair market value for this land. We could consider a reduction in the fair market value proportional to the airport passengers' share of the use of the rail extension compared to the total passengers. A release of "fee interest" in the land for the rail maintenance yard would require the same approval level as for the access road right-of-way discussed above. (0146 11-1)

> ***Response**: These issues will be the subject of continuing coordination among DRPT, WMATA, FAA, FTA, and MWAA. As discussed in Section 3.3 of the Final EIS, the Full LPA requires the acquisition of property interest in the median and other parts of the Dulles International Airport Access Highway and Dulles Connector Road, and in parts of the Dulles Airport property itself, including the site of the S&I Yard and portions of eight parcels that are currently leased to commercial entities. The Access Highway, Connector Road and Dulles Airport property are owned by the U.S. Department of Transportation (USDOT). MWAA has leased the property from the USDOT through the year 2067 and has sublet certain commercial parcels to businesses. DRPT will seek conveyance of the Access Highway, Connector Road and Airport property interest needed for the Project from the USDOT and MWAA. The acquired property interests will be adequate to assure DRPT's or WMATA's continuing control of the project property throughout the useful life of the project.'*

State Agency Comments

Continued Coordination with Local Entities

State Comment: VDOT is aware of the revisions proposed for the General Plans (PHR, A2). VDOT fully supports continuing, with full participation of transportation staff from Fairfax and Loudoun Counties as well as MWAA and TRIP II, a combined coordination effort with the DCRTP team to insure that the proposed rail alignments and station locations do not preclude potential future roadway improvements. (0091 11-1)

> ***Response:** Comment noted. The Project Team has consistently designed the Project in the General Plans so not to preclude future roadway improvements. To its knowledge, there are no roadway improvements that are precluded, or any future roadway improvements that still need to be accommodated.*

State Comment: VDOT looks forward to continued coordination by the Project Team in determining how to provide complete station access during preliminary engineering. VDOT recommends that the Project consider improving pedestrian and bicycle connections in the general vicinity (within 1 mile radius) of the proposed Station locations. VDOT looks forward to continued coordination on issues of station access-including bicycle/ pedestrian, taxi, bus, park and ride, kiss and ride, etc.

WMATA has listed bicycle and pedestrian accessible routes as the lowest priority for access and proximity to a station. VDOT recommends that in areas where no commuter parking is proposed, such as in Tysons Corner, these modes of transportation (bicycle and pedestrian) should be given a higher priority.

VDOT understands that an updated traffic analysis will be performed during the Final EIS and looks forward to working with the Project team during this critical stage to determine adequate mitigation measures for the project. This traffic analysis should address impacts on the existing transportation system in general.

VDOT looks forward to being part of the future business advisory team during preliminary engineering to discuss and minimize construction effects and maintenance of traffic in Tysons Corner and possibly

elsewhere within the project limits (i.e., Beltway/Route 123 interchange, Reston).VDOT anticipates coordination by the Project Team on a congestion management plan during this phase of the project. (0091 11-2)

Response: *The Project Team will continue to coordinate with Fairfax County, Loudoun County, Town of Herndon, VDOT and other stakeholders on pedestrian and bicycle access issues. As part of the Project, pedestrian, bicycle and vehicular access will be provided at each station site connecting to adjacent public rights-of-way. Comprehensive pedestrian circulation beyond the station areas may be implemented in conjunction with other planned developments, County and/or State projects. All stations would have bicycle racks and/or lockers adjacent to station entrances. Station access issues will continue to be explored in preliminary engineering. New pedestrian and bicycle facilities outside the station area would be beyond the scope of the Project, and would be the responsibility of VDOT and/or the local jurisdictions.*

Continued Coordination on Permitting and Master Agreement

State Comment: VDOT looks forward to continued coordination regarding permitting requirements and possible development of a master agreement between VDRPT and VDOT. (0091 0106-21)

Response: *Comment noted.*

Regional Agency Comments

Mitigate Any Adverse Effects on Dulles Airport Property

Regional Comment: The establishment of construction staging areas on Airport property will need to be coordinated with the Airports Authority to ensure that adequate provisions are made to mitigate potential adverse effects on existing and planned uses of candidate sites. (0131 0166-3)

Response: *During preliminary engineering, DRPT and WMATA will coordinate with the Metropolitan Washington Airports Authority in order to establish the most suitable construction staging areas.*

Local Agency Comments

Procurement Policies

Local Comment: WMATA and VDRPT should consider whether and how such an contractual arrangement for provision of construction services for a public sector project could trigger "disciplines" under GATS and other service agreements…. subject to international trade rules…. (0164 11-1)

Response: *Comments noted. The project will conform to appropriate procurement practices in accordance with federal and Commonwealth guidelines.*

Public Comments

Potential Station Facility Impacts

Public Comment: The proposed Route 28 station facilities north of the Dulles Toll Road may encroach slightly into a new RPA. Project designers should coordinate with the Office of Site Development Services on this issue. (0093 0109-20)

Response: *RPA stands for Resource Protection Area. This issue will be addressed during preliminary engineering in coordination with Fairfax County and VDOT.*

Address Traffic Impacts in Station Areas

Public Comment: I would suggest that the County take the lead in finalizing the design of access to the rail stations and the design of the parking facility. Well-planned, frequent bus feeder service can help reduce the impact of traffic on nearby roadways and neighborhoods in Loudoun County. (0060 0169-14)

> ***Response:*** *During preliminary engineering, DRPT and WMATA will oversee the design of the station facilities. Station access will be via planned roadways that new developments will likely design and construct. Feeder bus services for the two stations could be instituted by Loudoun County once the Full LPA is operational.*

Public Comment: To address concerns about increased congestion at the transit station areas, Fairfax and Loudoun counties need to make greater use of transportation demand management measures and work with developers and employers to provide incentives for carpooling, vanpooling, bicycling, walking, and using transit. Well-planned feeder bus service could help reduce the demand for expensive commuter parking. (060 0169-11)

> ***Response:*** *Comment Noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and have been considered by decision-makers in selecting the LPA.*

State and Local Coordination Needed for Mitigation and Funding

Public Comment: Where there is shared responsibility for mitigation, like for sound barriers and traffic calming, that state and local transit and transportation agencies: 1) coordinate on evaluating noise and traffic impacts and identifying the division of responsibility for undertaking and funding mitigation measures for the final EIS; and 2) seek their accelerated programming in the Commonwealth and regional transportation plans and budgets. (0026 0027-16)

> ***Response:*** *Proposed mitigation measures for the Project's unavoidable are summarized in Table 2.4-3 of the Final EIS. In each chapter on project effects, these impacts are identified and proposed mitigation measures are discussed. The FTA Record of Decision will include all final mitigation commitments.*

Public Comment: There should be better accountability for coordination between transit and transportation agencies on funding and implementing mitigation. (0087 0102-4) (0089 0104-4) (0099 0115-4)

> ***Response:*** *Comment noted. DRPT and WMATA will continue to coordinate with various agencies to ensure that all funding and mitigation issues are resolved.*

12.0 DEIS / SDEIS PROCESS

A. Draft EIS Comments

Public Comments

Selection of Comparison Years

Public Comment: The Project Team's response to the commenter's concern about comparable cost-effective measurements is unacceptable and fails to address the question of whether heavy rail can ever be justified, and at what point within the next 20-25 years would sufficient demand exist to justify cost. A more fiscally feasible approach starts with BRT and transitions to Metrorail after 2015 or 2020. By providing only opening year and 2025 data, the Draft EIS ignores the question of whether 2010 is a more appropriate year to compare BRT and heavy rail investment, than 2015 is. Officials, property owners, et al, need more comparison markers than the Draft EIS provides. (0446 12-1)

Public Comment: The *Public Hearings Report* ignores question on page 505 that states "DEIS documents that transit improvements are needed in the corridor in both 2010 and 2025." Disappointing that the DEIS fails to provide more guidance on critical issues and asks stakeholders to believe that 2010 and 2025 are the only relevant years. (0446 12-2)

> ***Response:*** *The Draft EIS was prepared in accordance with and meets the requirements of the National Environmental Policy Act (NEPA), as amended, and FTA regulations that implement NEPA and govern the transportation planning process. The selection of comparison years (opening and horizon) was based on standard practice for the evaluation of transportation projects. Planning and project development for a major capital investment focuses on those alternatives that will provide the best long-term solution for a corridor or region's needs. Therefore, alternatives are evaluated at a distant horizon year that allows decision makers to better understand each alternative's full potential. Data for interim years do not necessarily provide a true measure of the effectiveness or value of a proposed alternative, and would not accurately reflect the alternative's cost-effectiveness because it would not have yet reached its full potential. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

12.1 Concerns Over Study Process

A. Draft EIS Comments

Regional Agency Comments

NEPA Compliance

Regional Comment: The primary objective for the DEIS is to demonstrate the project's compliance with the National Environmental Protection Act. The WATF believes this objective was met as the statement demonstrates that none of the proposed alternatives need harm the environment, social justice, or preservation. However, the statement falls far short of proposing a plan that would adequately marry modern transit thinking to the long-term land use plans and transportation requirements of the Dulles Corridor. (0133, 0405-L –2)

> ***Response:*** *The Draft, Supplemental Draft and Final EIS meet the requirements of National Environmental Policy Act (NEPA) and FTA regulations that implement (NEPA) and govern the*

transportation planning process. Local jurisdictions oversee and have updated their land use plans in response to the Project.

Local Agency Comments

Local Comment The draft EIS has failed to meet the legal requirements of an Environmental Impact Statement regarding significant impact analysis in particular area as required by 40 CFR 1502.14 and 40 CFR 1508.9, including the City of Falls Church, which will be impacted by this proposed Project. The draft EIS has failed to fully assess water, traffic, and transportation impacts on the City of Falls Church and thus propose mitigation of these potential impacts. (0122, 0122-A –2)

Local Comment: EIS regulations state that the comprehensive analysis, including the proposed action, is the heart of an EIS (40 CFR 1502.14) and require a rigorous exploration and objective evaluation of reasonable alternatives, including a no action alternative. Reasonable alternatives include those that are practical or feasible from a common sense, technical, and economic standpoint. Federal regulations (40 CFR 1508.9) recommend that the EIS address environmental impacts in proportion to their potential significance. Impact analysis in intended to concentrate on project attributes that have a significant impact or potential for significant impacts. We contend that this EIS overlooked significant impacts as they relate to the City of Falls Church and its environs. (0122, 0122-A –7)

Local Comment: The City of Falls Church welcomes this opportunity to present the concerns of the City to the Virginia Department of Rail and Public Transportation (DRPT) regarding the draft Environmental Impact Statement (EIS) for the Dulles Corridor Rapid Transit Project (the Project). Although supportive of the Project, the City has some critical issues with regard to the EIS, which we feel must be addressed before the Project proceeds. Generally, we are concerned that although the City of Falls Church will be impacted by the Project, our community overall has been overlooked in the EIS. The impacts area of the Project includes the East and West Falls Church Metro Stations, which are located on the perimeter of our City limits. We believe that the impact to the citizens and the environment of the City of Falls Church has neither been assessed nor mitigation measures considered or developed. (0122, 0122-A –1)

Local Comment: The draft EIS has failed to meet the legal requirements of environmental statement regarding significant impact analysis in particular areas as required by 40 CFR 1502.14 and 40 CFR 1508.9, including the City of Falls Church, which will be impacted by this proposed project. (0122, 0164-T –3)

Local Comment: The reality is that Falls Church is the eastern terminus of this project, regardless of which of the alternatives are followed. Our first set of comments, summarized by Mayor Gardner, really relates to the technical, legal and factual issues which must be adequately addressed for a draft EIS and an EIS to pass muster under the law. (0165, 0165-T –1)

Local Comment: The City of Falls Church understands the legal requirements in the framework of the environmental impact statement, which is to assure that all issues, alternatives and concerns are weighed and evaluated for remedy. In attempting to meet these specific requirements, we believe that mitigation of the project impact on the city of Falls Church and its immediate surroundings has not been sufficiently addressed. (0122, 0164-T –7) (0122, 0122-A-6)

Response: *The Draft EIS, Supplemental Draft EIS and Final EIS fully comply with the regulations cited. Each EIS included a detailed analysis and objective evaluation of a No-Build Alternative as well as the Build Alternatives. All alternatives carried forward for detailed study in the Draft EIS were those deemed to be reasonable from an operational, technical, and economic standpoint, as documented in the Final Alternatives Analysis Report.*

The Project Team initiated meetings with the City of Falls Church during the course of the NEPA process to more fully understand the concerns and position of the City as it relates to the project and the EIS'.

The Project Team is confident in the comprehensiveness of the Draft EIS, having received a positive statement from the U.S. Environmental Protection Agency (EPA). EPA has granted the Draft EIS its highest rating for environmental documentation, and remarked that it has not identified any potential impacts that would require substantive changes to any alternative.

Public Comment: Draft EIS does not satisfy the requirements of the National Environmental Policy Act (NEPA). Data presented and methodology used are not sufficient to support selection of a Locally Preferred Alternative. (0510 12-01)

Response: *The Draft EIS fully complies with the regulations cited. The Draft EIS includes a detailed analysis and objective evaluation of a No-Build Alternative as well as four Build Alternatives. All alternatives carried forward for detailed study in the Draft EIS were those deemed to be reasonable from a common sense, technical, and economic standpoint, as documented in the Final Alternatives Analysis Report.*

Need for Additional Assessment of Impacts

Local Comment: Our review of the draft EIS indicates that these key concerns have not yet been addressed for the City of Falls Church. The Project, while appearing to be beneficial to the region, has a significant and direct negative impact on the City in a manner not yet fully analyzed in the draft EIS. Additionally, we believe the Project has large-scale and complex impacts on the City. We have previously asked that these impacts be thoroughly studied (Attachments 1-4), however, we have now concluded that they have not been given full consideration. (0122, 0122-A –10)

Local Comment: Following our review of the Draft EIS, we are particularly troubled that the impacts to the East Falls Church Metro apparently have never been considered. For this reason, we find the EIS significantly flawed and formally request that this are be examined and fully evaluated. (0122, 0122-A – 11)

Local Comment: Page 8 of the summary lists those in four categories: Social effects; environmental effects; economic effects; and transportation effects. We believe that at a minimum this project, regardless of its alternatives, has the following social effects: Community cohesion; displacement and relocation; visual and aesthetic conditions; parklands and recreation areas; and especially safety and security, especially regarding pedestrians and school students in the [Falls Church] area. Secondly, as Mayor Gardner indicated, there may be very significant water resources effect, air quality, noise, vibration, hazardous and contamination materials and other effects. Third, in terms of economic effects, its unequal economic effect is something that deserves additional study. Finally, transportation effects again are inadequately studied under this draft EIS. And they include effects on local and regional roadways, transit parking, and bicycle and pedestrian facilities. And we have a written submission, which we ask be a part of this record. (0165, 0165-T –2)

Local Comment: While a limited analysis was performed for the West Falls Church Metro station, we discovered that project impacts were not considered in many of the Technical Reports including Land Use and Socioeconomic, Air Quality and Economics, and Secondary Development Effects. Although West Falls Church Metro is included in the Noise Technical Report, we are concerned that the full impact has not been analyzed. We believe very strongly that the EIS must be revised to consider impacts in all Technical Reports for both the East and West Falls Church Metro areas. This project impacts our resident' quality of life in a myriad of ways and these impacts must be considered in order to be fully compliant with Federal EIS regulations. (0122, 0122-A –12)

Local Comment: Finally, it is our position that there is still much work to do in order for the Draft EIS to address the long-range concerns that have been previously raised by the City, including the safety concerns that continue to be paramount in the minds of our citizens, and which have not yet been studied, let alone, resolved. (0122, 0122-A –29)

Local Comment: If we address the issues that we have outlined tonight, we believe that this project will

achieve those objectives. If we don't, it fails as an EIS and it will fail as a project that serves the region. (0165, 0165-T –10)

Local Comment: Now as a matter of law and as a matter of fact, we believe that additional work needs to be done, and that the draft EIS and any EIS that fails to address these issues would be inadequate and incomplete as a matter of law. (0165, 0165-T –3)

Local Comment: So for all the reasons indicated, we urge a much more significant study of the issues that we have talked about, that we urge inclusion of mitigating factors, and finally we urge that, not just for the citizens of Falls Church, but all the citizens of this potential region, because if it works for us, it will work for the region. If it doesn't work for us, it won't work for the region, either. (0165, 0165-T –8)

> ***Response:*** *Implementation of the Project would result in increased off-peak service frequencies for eastbound trains at the East Falls Church Station. However, operating plans for the Wiehle Avenue Extension and Full LPA assume no additional feeder bus service, nor any new parking for the off-peak period for this station. Because the station's existing park-and-ride facilities are typically full by 8:00 AM on most weekdays and parking is controlled on local streets, it is not anticipated that increased off-peak Metrorail frequencies would generate additional traffic in and around the East Falls Church Metrorail Station. While the Project Team does anticipate other effects, as there would be no change from existing conditions, meetings with the City of Falls Church were held to discuss the issues of overflow parking and cut-through traffic due to the selected LPA, the Metrorail Extension.*

Public Comments

Need for Additional Assessment of Impacts

Public Comment: Only a systematic approach that considers how the impacts of a change in one part of the system will affect the whole system can have credibility. We feel that this EIS lacks credibility where it assesses environmental impacts. To summarize, we support rail to Dulles. Unfortunately, we believe the EIS as it relates to impacts needs a lot of work. (0145, 0145-T –13)

Public Comment: To summarize, we support the expansion of public transit and rail to Dulles. Unfortunately, we believe the EIS, as it relates to impacts and mitigation, is flawed and needs a lot of work. (0145, 0452-E –11)

> ***Response:*** *The Draft EIS, Supplemental Draft EIS and Final EIS document the systematic approach that was undertaken to assess the potential effects of the proposed alternatives. Each EIS document analyses the effects of the alternatives, cites the relevant laws and regulations considered, describes the methodologies used, defines the study areas assessed, summarizes the existing conditions in the study areas, predicts the direct and construction related effects, and proposed mitigation measures available to reduce the effects of unavoidable impacts.*

Need for Additional Public Outreach

Public Comment: The citizens in the adjacent Victoria farms are not uniformly aware of the current actions recommended in the DEIS. I believe that no one in the Victoria Farms community has a copy of the DEIS and with the exception of those with whom I recently have made contact, is anyone even aware of its content. That seems strange in view of the potentially serious impact on this community and may be an indication of ill advisability of issuing this ~3000 page document in the middle of the summer with a hurry up agenda for review and approval. (0148, 0463-L –3)

Public Comment: Public participation requirements can be found throughout the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of NEPA (40 CFR Parts 1500-1508). For example, the Council on Environmental Quality Regulations note that public scrutiny is essential to implementing NEPA. We feel that additional effort should have been made to contact

neighborhoods/ communities to encourage and facilitate public participation. This is evidenced in the list where many of the meetings were with groups who held a business interest. (0147, 0459-L –3)

> ***Response:*** *As documented in Chapter 11 of the Draft EIS, Supplemental Draft EIS and Final EIS, the Project Team has conducted a comprehensive public involvement program. A variety of methods were used to encourage citizens to participate in the project since initiation of the Dulles Corridor Rapid Transit Project, including: public meetings, project displays at shopping centers and fairs, project documents at libraries and community centers, and print, radio, and electronic media, project newsletters and updates, and stakeholder meetings with private citizens, community groups, civic associations, and businesses. In addition, prior to the public hearings on the Draft and Supplemental Draft EIS, all residents and property owners within 500 feet of the proposed improvements were notified about the hearings.*

Public Comment: The EIS process must be put on hold. While the EIS is on hold, additional bus service by Fairfax County, Metrobus and Loudoun County ("Yellow") can be put in place to handle additional demand for transit capacity - at much lower cost than any of the "build" alternatives in the DEIS. VDRPT should assist in this regard. (0112, 0462-L –47)

> ***Response:*** *The purpose of the environmental review process is the study of various alternatives that meet the project's purpose and need. Express bus service and enhanced express bus service, which are part of the existing conditions in the Dulles Corridor, were considered in this Draft EIS under the No-Build Alternative.*

Public Comment: We do have serious issues, however. These would be about noise and traffic - both during and after construction! For our purposes, neither of these issues is sufficiently addressed, if at all, in the EIS. I and others have personally attended all public meetings on this issue over the last two years, and in speaking with project representatives at such meetings, we were assured that our concerns would be addressed in detail. Sadly, this has not happened. (0126, 0199-M –2)

> ***Response:*** *Traffic and noise issues are addressed in the Final EIS.*

Need for Appropriate Mitigation of Impacts

Public Comment: As indicated at the beginning, we are not obstructionists and we are not playing the NIMBY card - in fact quite opposite. However, we urge you please to address the impacts which we have discussed here, and do what needs to be done to mitigate the problems. Let's make a win-win proposition for all concerned. (0126, 0126-E –8)

Public Comment: The point here is that as citizens directly affected by a massive public project, the EIS has told us nothing about it's assumptions, it's projections, or it's mitigation plans - as it relates to street traffic, and noise impacts, in the immediate area of West Falls Church Metro Station. We are essentially being asked to "take it on faith" that everything will be taken care of. This is patently unrealistic; there are several levels of government involved here, and experience shows sadly that these entities do not work well in a situation like this. Bottom line, no one is going to mitigate someone else's problem. The game ultimately becomes one of finger pointing, with nobody responsible, and the effected citizens living with the results. (0126, 0126-E –7)

Public Comment: The point here is that as citizens directly effected by a massive public project, the EIS has told us nothing about it's assumptions, it's projections, or it's mitigation plans - as it relates to street traffic, and noise impacts, in the immediate area of West Falls Church Metro Station. We are essentially being asked to "take it on faith" that everything will be taken care of. This is patently unrealistic; there are several levels of government involved here, and experience shows sadly that these entities do not work well in a situation like this. Bottom line, no one is going to mitigate someone else's problem. The game ultimately becomes one of fingerpointing, with nobody responsible, and the effected citizens living with the results. As indicated at the beginning, we are not obstructionists and we are not playing the NIMBY card - in fact quite the opposite. However, we urge you please to address the impacts which we have

discussed here, and do what needs to be done to mitigate the problems. Let's make this a win-win proposition for all concerned. (0126, 0199-M –7)

Response: *The Final EIS describes the assumptions, existing conditions, potential effects, and measures to mitigate any significant or unavoidable impacts. Proposed mitigation measures are detailed in the Final EIS and formal mitigation commitments will be included in the FTA Record of Decision.*

Document Bias Towards Heavy Rail

Public Comment: I believe the study is biased toward heavy fixed rail partly because of the methodology to computer ridership and alignments chosen for BRT and rail stations, in essence to enhance the values of specific developers. (0112, 0462-L –1)

Public Comment: THE DEIS IS SUBSTANTIALLY BIASED TOWARDS RAIL:
The bias towards MetroRail in this DEIS is blatant. Much of the information in the DEIS has been contorted to make heavy rail appear much better than it really is. Some examples are:

§ inflated ridership estimates compared to no build and BRT;

§ exaggerated travel times compared to actual experience on existing MetroRail facilities;

§ counting trips diverted from the Orange Line as new trips and boardings on Dulles Rail;

§ unrealistic land use proposals to create extra density to justify the inflated ridership figures;

§ gerrymandered traffic analysis zones that do not match those used by Fairfax County's plans. (0138, 0476-L –4)

Public Comment: THE DEIS IS HEAVILY BIASED AGAINST BRT: The bias against BRT include the following examples:

§ The DEIS fails to assume dedicated express lanes for the entire BRT route;

§ Fails to include BRT stops in Tysons Corner;

§ Insists on assuming BRT is merely a prelude to MetroRail instead of assuming BRT can be the single long-term solution; the assumption that BRT has to lead to MetroRail then leads to cost problems that lead to assumptions of fewer stations per mile than other BRT systems use;

§ fails to locate and design BRT stations in the most cost-effective manner;

§ fails to recognize that BRT routes can terminate anywhere, not just at West Falls Church station, thereby allowing customized routing that rail cannot match;

§ fails to provide frequency of service [headways] comparable to that offered by most existing BRT systems;

§ fails to utilize the flexibility of BRT;

§ failure to recognize and value how quickly BRT can be operating;

§ fails to value the feeder bus-express bus integration that is possible with BRT;

§ in short, fails to design a BRT that uses the advantages the system has exhibited in the cases where it already is in operation. (0138, 0476-L –5)

Response: *The ridership forecasts for the various alternatives were conducted using a patronage forecasting model (NVSIM) that was developed for the region and the corridor, and has been approved for patronage forecasting by the Federal Transit Administration. As described in Chapter 6 of the Final EIS, travel demand forecast results are based on the Metropolitan Washington Council of Governments (MWCOG) Round 6.3 Cooperative Land Use Forecasts. The Round 6.3 forecasts represent the regionally adopted population and employment forecasts,*

through 2025, for the metropolitan Washington area, including Fairfax and Loudoun counties. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. More specifically, model assumptions regarding socioeconomic variables and land use must be consistent among alternatives so as to not bias the results of the travel demand forecasting process. Therefore, the ridership estimates presented for the project do not reflect recent amendments to county comprehensive plans to permit additional residential, retail, and office development around stations, and do not reflect the ridership that would be anticipated with increased development in station areas.

Run time analysis data presented in the Transit Operations and Maintenance Plan (June 2002) show that the Full LPA, which includes 11 stations between the end of the line and the East Falls Church Station, has a travel time of approximately 41 minutes from East Falls Church to Route 772, resulting in an average speed of 35.4 mph for this 24-mile segment. WMATA's website shows that for a trip between Shady Grove and Metro Center (a section that includes 13 intermediate stations and no transfers) travel times are 34 minutes for a 17-mile distance. The average speed for this trip would be 30 mph. Although the average speed for the Dulles Corridor is higher, it is not inconsistent with experience on existing Metrorail facilities. The Dulles Corridor line is longer than the Shady Grove-Metro Center section, it includes fewer intermediate stations, and it includes two station-to-station intervals that are approximately 5 to 6 miles in length. Therefore, a slightly higher average speed would be expected.

The ridership estimates presented in Table 6.1-3 of the Final EIS do not count trips diverted from the Orange Line as new transit trips. As described in the Final EIS, the number of regional new riders is calculated by subtracting the total number of transit trips expected under the No-Build Alternative (this include all modes of transit in the region) from the total number of transit trips expected under each Build Alternative. Any increase in the number of regional transit riders is counted as new riders. A person switching from the Orange Line to the Dulles Corridor line would not register as an increase in the number of total transit trips.

The boardings presented in Table 6.1-3 represent a trip maker getting on the Dulles Corridor train at a station in the corridor. Whether this person is a new transit rider or a person that previously boarded the Metrorail Orange Line, the fact that he now boards the train in the Dulles Corridor reflects demand for the Dulles Corridor line. This line is a more convenient travel alternative for this trip maker. And given that the Orange Line currently experiences overcrowding, the Dulles Corridor line's ability to attract riders away from the western end of the Orange Line benefits the regional transit system. Only the analysis of development-related traffic effects in Tysons Corner and the mid-corridor used a refined a more refined geographic data structure. This structure was co-developed by Fairfax County, and allowed a much more detailed analysis than was possible with the land use data structure developed by the MWCOG.

Public Comment: A review of the DEIS and the associated technical reports indicate that the analysis reflects a strong support for the metrorail alternative. This is reflected in the analysis of BRT, assessment of social and economic factors and the remaining categories of assessment areas. The DEIS is deficit as evidenced by the lack of specificity in the community and neighborhood impact assessments. (0147, 0459-L –1)

Response: *The Draft EIS and its Technical Reports did not indicate a preference for any of the alternatives considered. The social, environmental, economic, and transportation related effects of the BRT Alternative were assessed using the same methodologies as the other alternatives studied. The impact assessment for the community and neighborhoods, including the methodologies used, existing conditions, and predicted effects are presented in the Draft EIS in summary form for its four Build Alternatives and in the Final EIS for its two Build Alternatives.*

NEPA Compliance

Public Comment: The DEIS failed to address the issues coupled with full implementation of 23 USC 109 (h). The DEIS failed to follow the NEPA process by limiting the geographical study area around the transit stations. (0147, 0459-L –7)

> ***Response:*** *Full implementation of 23 USC 109(h) is the responsibility of the Secretary of Transportation and was supplemented by publication of the regulations contained at 23 CFR Part 771. The geographic study areas defined depended on the resource under study as illustrated by the following examples. For example, air quality effects were considered for the entire Washington metropolitan region (to study ozone) as well as areas near transit stations (to study carbon monoxide levels). For noise, a distance of 1,000 feet from the proposed alignments was used to determine the number, location, and types of noise-sensitive receptors along the corridor. For neighborhoods and parklands, the study area was generally 300 feet on both side of the proposed alignments and greater in areas where the noise and/or visual impact assessment predicted effects at distances beyond 300 feet.*

Public Comment: In the published document I was unable to locate the applicable Federal Regulation cite such as 23 CFR 777, 40 CFR-1502, etc. As a citizen this information should have been contained in the report in order to perform an effective analysis to ensure that the requirements have been complied with fully. (0189, 0448-E –1)

> ***Response:*** *The Draft, Supplemental Draft and Final EIS' were developed in accordance with FTA regulations governing the transportation and environmental planning process (23 CFR 771) and Council on Environmental Quality's regulations that implementing the National Environmental Policy Act (40 CFR 1500).*

Public Comment: Accordingly, in reviewing the DEIS, I found it inadequate as to prevent a meaningful analysis, and as such I am hereby requesting a supplemental DEIS be undertaken to address my concerns and other concerns raised by concerned citizens. (0189, 0448-E –10)

> ***Response:*** *The Draft, Supplemental Draft and Final EIS have met the requirements of National Environmental Policy Act (NEPA) and FTA regulations implementing (NEPA) and govern the planning process.*

Public Comment: Impact of a Potomac River Crossing up-stream of the American Legion Bridge was not considered. It is submitted that such a crossing would impact on the Dulles Corridor transit routes used to enter/exit DIA both the passenger and commercial traffic. (0427, 0427-E –5)

> ***Response:*** *A new crossing of the Potomac River upstream from the American Legion Bridge is not part of the Dulles Corridor Rapid Transit Project, as defined in Chapter 2 of the Final EIS. In addition, such a bridge is not part of any program, ongoing planning study, or long-range plan.*

Need for Additional Assessment of Impacts

Public Comment: Community impacts deserve serious consideration in project planning and development. Public involvement should be fully integrated within planning and project development. For the community near the Golf Park, I believe the process as implemented failed in this respect. (0148, 0463-L –4)

> ***Response:*** *Comment noted. No effects are projected for communities in proximity to the Golf Park located on Hunter Mill Road. The two Build Alternatives of the Final EIS do not result in any changes in this section of the corridor and no noise, vibration, or visual effects are projected. Any increase in densities allowed by Fairfax County as a result of the Project are not anticipated within this neighborhood.*

Public Comment: The Draft Environmental Impact Statement (EIS) on the Dulles Corridor Rapid Transit Project in the Dulles Corridor is flawed, incomplete and inadequate in its analysis of the impact on Reston residential neighborhoods of this project and accompanying densities. (0454, 0454-E –1)

> ***Response:*** *The Land Use and Socioeconomics Technical Report (June 2002) describes the effects of the alternatives on neighborhoods in Reston. This analysis is supplemented in the Economics and Secondary Development Effects Technical Report (June 2002). The analysis documents that increasing densities in the transit station areas will increase traffic and create the potential for spillover parking that could affect several neighborhoods in Reston, primarily those located along Sunrise Valley Road. These impacts are presented in Sections 3.5 and 3.9 of the Final EIS.*

Public Comment: We would like to express our concern that the Draft Environmental Impact Statement for the proposed Dulles Rapid Transit Project does not comprehensively address effects on the human environment, as required by the National Environmental Protection Act. It is our belief that a project of this magnitude will have residual impact on the residential communities of the historic Hunter Mill Road Corridor and that Congress intended those impacts to be identified and thoroughly evaluated before a Dulles transit alternative is chosen. (0460, 0460-L –1)

> ***Response:*** *No effects are projected for communities in proximity to Hunter Mill Road. The two Build Alternatives of the Final EIS do not result in any changes in this section of the corridor and no noise, vibration, or visual effects are projected. Any increase in densities allowed by Fairfax County as a result of the Project are not anticipated within this neighborhood.*

Public Comment: The study was conducted using "traditional transit" approaches and estimating procedures; however, an undertaking of this magnitude - and the implications of this study - should not be addressed simply from a "transit" perspective. The social and economic perspectives should be examined. (0235, 0235-E –1)

> ***Response:*** *The effects of the proposed alternatives were assessed from a social, environmental, economic, and transportation perspectives as documented in Chapters 3, 4, 5, and 6 of the Final EIS. In addition, the performance of the two Build Alternatives was assessed against the No-Build Alternative in Chapter 10 of the Final EIS.*

B. Supplemental Draft EIS Comments

Public Comments

NEPA Compliance

Public Comment: I requested the project team to explain how it can avoid comparing rail to express bus, AND publishing a Federal Register notice BEFORE embarking on an SDEIS, when the FTA rules read: "A supplement is to be developed using the same process and format (i.e., draft EIS, final EIS, and ROD) as an original EIS, except that scoping is not required." (0016 12-01)

> ***Response:*** *A Notice of Intent was published for the Dulles Corridor Rapid Transit Project Final EIS in the Federal Register on June 26, 2000 (Volume 65, Number 123). Pursuant to 23 CFR Part 771, Environmental Impact and Related Procedures, a Notice of Intent is not required for a Supplemental Draft EIS.*

Public Comment: Because WMATA was selected as the study consultant, the Locally Preferred Alternative recommendation was a forgone conclusion. “Study” and public hearing process nothing more than window-dressing. Federal law requires an independent non-conflicted analysis of the alternatives, and this was not done. (0162 12-1)

Response: *The Draft EIS, Supplemental Draft EIS and Final EIS document the systematic approach that was undertaken to assess the potential effects of the proposed alternatives. Each EIS document analyses the effects of the alternatives, cites the relevant laws and regulations considered, describes the methodologies used, defines the study areas assessed, summarizes the existing conditions in the study areas, predicts the direct and construction related effects, and proposed mitigation measures available to reduce the effects of unavoidable impacts.*

Public Comment: There was no consideration at all to slug lines or HOT lanes. Combining these with enhancements to existing bus service would meet transit needs for the foreseeable future. (0162 12-2)

Response: *While NEPA requires an evaluation of all reasonable alternatives, it allows alternatives to be eliminated prior to detailed studies as long as the reasons for eliminating them are discussed in the EIS. The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. For the initial evaluation, most measures were qualitative. The alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.*

Neither the Project Team nor VDOT could develop facilities with the express purpose of encouraging just-in-time ridesharing (also known as "slugging" or casual carpooling) because of the tremendous liability risk associated with such activities. While these agencies recognize the benefits that have been gained in the I-95/I-395 corridor through this informal ridesharing arrangement, the random pairing of drivers and passengers inherent in this form of commuting presents risks that most public agencies are not prepared to assume.

Public Comment: Agrees with the article from the American Planning Association regarding cost over-runs, and believes that the Project Team has intentionally underestimated the project costs in order to sway decision-makers. (0162 12-3)

Response*: Chapter 8 of the Final EIS discusses the capital cost estimates and capital funding strategies for the two Build Alternatives. Every effort is being made to avoid cost overruns. The ultimate cost of the LPA relies on a number of assumptions, including project schedule, major cost drivers, inflation rates, expenditure forecast, funding availability, and financing requirements. During the Project's next phase of preliminary engineering, DRPT will prepare a final financial plan for the Wiehle Avenue Extension, which will include an update of the capital cost estimate and a formal risk assessment. Section 8.3 of the Final EIS provides an initial discussion of risks and uncertainties.*

The recent completion (January 2001) of the original Metro 103-mile system was done on or ahead of schedule and considerably under budget.

Public Comment: Suggests that the Project Team is pushing the Metrorail Alternative because interested parties (i.e., the Project Team and decision makers) have a vested interest and could profit from the selection of Metrorail, thereby side-lining the cheaper alternatives. (0162 12-4)

Response: *The Draft EIS, Supplemental Draft EIS and Final EIS document the systematic approach that was undertaken to assess the potential effects of the proposed alternatives. Each EIS document analyses the effects of the alternatives, cites the relevant laws and regulations considered, describes the methodologies used, defines the study areas assessed, summarizes the existing conditions in the study areas, predicts the direct and construction related effects, and proposed mitigation measures available to reduce the effects of unavoidable impacts.*

Public Comment: Again suggests that the Project Team is pushing Metrorail by increasing the costs of BRT in comparison to those of light rail. Supports BRT with HOV lanes because it is the cheapest alternative and would benefit the most people. (0162 12-5)

> ***Response****: Comment noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and have been considered by the decision-makers in the selection of the Locally Preferred Alternative (LPA).*

No Comparisons to Alternatives Other Than No-Build

Public Comment: While rail to Tysons alone might be a good idea this SDEIS is still flawed because it does not compare rail to any other alternative than "no build." (0016 0122-2)

> ***Response:*** *Other modes, including the No-Build Alternative were considered in the Draft EIS published in 2002 for the Dulles Corridor Rapid Transit Project. Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the LPA by the Commonwealth Transportation Board (CTB) and by the WMATA Board of Directors in late 2002. The purpose of the Supplement al Draft EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS public hearings report.*

Need to Change the Forecast Horizon Year

Public Comment: County staff questions the evaluation of alternatives using a 2025 forecast horizon year. Results for the full LPA should use a broader forecast horizon year given that the full build LPA would be in operation by 2015. County staff does not feel that a 10 year forecast horizon provides an adequate description. (0084 0099-1)

> ***Response:*** *2025 was used as the project horizon year in the Draft EIS, Supplemental Draft EIS, and Final EIS because it allows a comparison to be made of the proposed alternatives in a future year in which they would have achieved their full potential. In addition, the forecast year also reflects the availability of land use, population and economic projections, which are the basis for the technical analyses conducted as part of the NEPA process.*

Concerns about "WMATA/DRPT Roles in the Project

Public Comment: Virginia and WMATA should rethink their use of WMATA as a technical advisor. Much of the project's opposition is vested in a belief that WMATA's involvement in the design and build of the Dulles Corridor extension as a consultant will guarantee massive cost overruns. This concern is vested in the agency's historic record, in its execution of the DEIS as a contractor to Virginia's DRPT and in its executives' attitude towards Virginia as a customer. (0108 0127-11)

> ***Response:*** *DRPT, as the project sponsor, will be the contracting authority for the project's implementation and the recipient of Federal and non-Federal funds. It will acquire right-of-way, apply for environmental permits and bear responsibility for mitigation commitments. DRPT has engaged WMATA as the technical manager for preliminary engineering, final design, construction, and start-up and testing. WMATA has the expertise and resources to assure that the completed project is ready for safe, secure, efficient operations.*

Public Comment: The proposed rail based transit system for the Dulles Corridor is projected to cost over $3.5 billion. Such costly systems provide lucrative long-term contracts, including the contract to WMATA. CEQ Regs Section 1506.5 (c) "prohibits an entity entering into a contract with a federal agency to prepare the EIS when that party has at that time and during the life of the contract pecuniary or other interests in the outcomes of the proposal." Among some, there is a public perception of bias where the LPA is rail.

How were the conflict of interest issues dealt with in regards to WMATA's responsibility for the preparation of the DEIS and SDEIS? Disclosure statements or evaluation of potential conflicts of interest should have been prepared. Are these documents available for public review? (0109 0128-4)

> ***Response:*** *Under the applicable Council on Environmental Quality (CEQ) regulation [40 CFR Sec. 1501.5(b)], WMATA, an interstate compact transit agency, is a joint lead local agency for NEPA purposes, and it is not classified as a retained outside contractor. By its very creation as an interstate compact agency, WMATA's purpose is to plan, finance, construct and operate a comprehensive mass transit system for the Washington metropolitan area, which includes Metrorail, Metrobus and MetroAccess. Thus, it is the most appropriate party to prepare environmental impact statements for transit projects of its system. There is no monetary gain for WMATA or its Compact member jurisdictions from the planning and implementation of the Project. Rather, WMATA will bear additional subsidy payments to operate and maintain the Project. Pertinent WMATA staff members on an annual basis do complete a Confidential Statement of Affiliations and Financial Interests under the policy, Standards of Conduct for WMATA Employees. There has been no disclosure of potential conflicts of interest by WMATA employees. The statements are confidential. As separately required by 40 CFR Sec. 1506.5(c), the WMATA-retained outside contractors, who are involved in the preparation of the EIS documents, signed notarized continuing disclosure statements regarding potential conflicts of interest as to this Project. For project integrity, the lead federal agency, the Federal Transit Administration, will independently review all the EIS documents for NEPA regulatory compliance, among other effects, prior to its final action regarding the proposed Project.*

Public Comment: Faulty Sponsorship: The project has inadequate sponsorship. WMATA is barely capable of running the existing MetroRail system, as evidenced by the frequent newspaper reports of its financial problems. Until it gets its own house in order, it should not undertake such a massive and economically risky undertaking. (0072 0150-5)

> ***Response:*** *DRPT is the Project sponsor and initial owner. WMATA is DRPT's technical manager and will be operator of the completed extension. Under its Metro Matters campaign (see www.wmata.com/about/metro-mattersfactsheet.pdf), WMATA is presently seeking the absolute minimum funding of its near-term capital needs to sustain the Metrorail and Metrobus systems.*

Public Comment: Apparent conflict of interest: The Project also would result in adoption of a fee schedule that rewards DRPT/WMATA as the project managers for selecting the most expensive system rather than the most cost-effective one under the FTA criteria. (0072 0150-8)

> ***Response:*** *The selection of the Metrorail Build Alternative as the proposed Locally Preferred Alternative by the WMATA Board of Directors and the Commonwealth of Virginia Transportation Board in November and December 2002, respectively, was based on the reasons in the Final Recommendations of the Project Team outlined in the Draft EIS Public Hearing Report Supplement (November 2002).*

Clarifications Regarding Analysis Process and Documentations

Public Comment: Please explain how the failure to model any alternatives to Metrorail in Tyson's Corner is consistent with NEPA's clear requirement to consider all reasonable alternatives. Moreover, please explain the legal and regulatory context used to determine that Phase I has "independent transportation utility" and is an MOS of the full LPA. (0063 0151-3)

Public Comment: How were these determinations made, who made them, was there an analysis conducted, and what authority, standards, and guidance were relied upon? If an analysis was conducted, why was it not included in the SDEIS? (0063 0151-4)

Public Comment: Did the SDEIS meet the legal requirements of NEPA process by terminating the rail at Wiehle? That is the legal question to be answered. (0109 0147-2)

Response: *The Project Team, with FTA and in cooperation with FAA, has prepared the Draft EIS, Supplemental Draft EIS and Final EIS in accordance with the provisions of the National Environmental Policy Act (NEPA), as amended. The Scoping Process Report and the Final Alternatives Analysis Report (and its Addendum) document the identification of alternatives and issues and describe the initial and intermediate screening of alternatives, respectively.*

Public Comment: 40 CFR 1502.10 states that index should be detailed enough so that it is useful for the readers. Please explain why the DEIS and the SDEIS did not have an index. (0109 0128-25)

Response: *The Council of Environmental Quality (CEQ) guidance regulation cited refers to a recommended format to be used for environmental impact statements. The Draft EIS, Supplemental Draft EIS and Final EIS meet CEQ requirements; the Table of Contents provides a detailed listing of the EIS' contents, tables, and figures.*

Public Comment: No bus alternative was compared to the new locally preferred alternative (LPA), i.e., rail from West Falls Church to Wiehle Avenue, yet a "no build" option was studied. Probably more important, it appears that neither FTA for VDRPT and WMATA (henceforth, "the project team") placed a notice in the Federal Register that a supplemental DEIS was being pursued -- as is customary for all FTA projects. Perhaps had the public had an opportunity to provide input on the SDEIS from the get-go, the team would have studied a BRT alternative, as it did with the FTA New Starts Evaluation that went on concurrently. (0016 0122-12)

Response: *A Notice of Intent was published for the Dulles Corridor Rapid Transit Project Draft EIS in the Federal Register on June 26, 2000 (Volume 65, Number 123). Pursuant to 23 CFR Part 771, Environmental Impact and Related Procedures, a Notice of Intent is not required for a Supplemental Draft EIS.*

Project Phasing Concerns

Comment: The SDEIS relies on phased construction "to spread the costs of construction over a longer period of time to reduce annual funding needs" since FTA "may consider the proposed subsequent phase for FTA funding in the future, but has made no commitment to do so. FTA will make a decision on the funding of the first phase without regard to possible future phases." (SDEIS at 1-2). Under NEPA protocols, a severed project which may never continue into phase 2 cannot masquerade as a phased project and does not qualify as a single, segmented project that could be feasibly implemented. The SDEIS must analyze only what the authors refer to here as Phase 1. (0068 0173-4)

Response: *The Supplemental Draft EIS discussed differences in impacts due to phased construction of the LPA. To emphasize the independent transportation utility of the 11.6 mile Metrorail extension to Wiehle Avenue, the FTA and DRPT have renamed 'LPA Phase 1' to be 'Wiehle Avenue Extension'.*

DEIS/SDEIS is not adequate

Public Comment: A New DEIS is required: The SDEIS makes such material changes to the previously-submitted DEIS that it is de facto a new project that needs its own complete DEIS. (0072 0150-1)

Response: *The Supplemental Draft EIS did not make changes but rather discussed differences in impacts due to phased construction of the LPA.*

Public Comment: Deficiencies in claimed environmental benefits: The SDEIS fails to document accurately the environmental impacts that will result from placing the terminus of Phase I at Wiehle Avenue, it fails to properly advance a mitigation plan, and it makes no attempt to show a method to fund the mitigation plan to the extent a rudimentary one is proposed. (0072 0150-9)

Response: *The Project Team, with FTA and in cooperation with FAA, has prepared the Draft EIS, Supplemental Draft EIS and Final EIS in accordance with the provisions of the National Environmental Policy Act (NEPA), as amended. DRPT is the project sponsor. In coordination with VDOT, Fairfax County, Loudoun County and the Town of Herndon, it has determined the improvements for station access, the funding of such improvements, and their ownership and maintenance. Section 6.4 of the Final EIS discusses these roadway improvements.*

Contractors Used in Preparation of DEIS/SDEIS

Public Comment: Identify the contractors who prepared the DEIS and the SDEIS who presently hold contracts with DRPT or with WMATA. Identify the contractors who prepared the DEIS and the SDEIS and can you categorically confirm right now that to avoid conflict of interests, that none of the contractors nor their substantially related entities will be awarded any contracts for the construction of this project in contravention to the aforementioned CEQ Regs. (0109 0128-5)

Response: *The WMATA consulting firms that have prepared the Project's EIS are listed in Appendix A, List of Preparers. The following statement is at the end of Appendix A of the Draft EIS: References throughout this document [Draft EIS] to Capital Transit Consultants refer to a consortium of consulting firms under contract to the Washington Metropolitan Area Transit Authority (WMATA) to provide environmental, planning, engineering, architectural, and management services in support of the preparation of this document. Capital Transit Consultants is a consortium of four firms under separate contract to WMATA. Member firms in the consortium who assisted in the preparation of this document are: DMJM/DELEUW (a joint venture of DMJM+HARRIS, Inc. and Parsons Transportation Group and subconsultants to the joint venture) and Parsons Brinckerhoff Quade & Douglas and subconsultants. The other two members of the Capital Transit Consultants consortium did not participate in the preparation of this document because of potential involvement in the implementation phase of the project. The above three WMATA consulting firms that have prepared the Project's EIS did complete Disclosure Statements on Conflicts of Interest in accord with the CEQ regulation and FTA rule. There was no disclosure of any conflicts of interest. Copies of these disclosure statements are included in Appendix A of the Final EIS.*

Project Scoping

Public Comment: Apparently due to the way the rail proponents are conducting their high-stakes and high-cost business, this SDEIS has been manipulated in its scoping. The effect has been to keep out meaningful debate and informative input. In fact, my request for a meaningfully scoped SDEIS was rejected by WMATA months ago. (0068 0076-2)

Public Comment: How is this extension of Metrorail one bit different than any other project, independent project, that has ever been considered, Phase 1. How would Phase 2 not be a completely independent separate project? It seems to me these are two completely different projects and, as a different project, an independent project, Phase 1 deserves it own complete DEIS. (0072 0082-2)

Public Comment: The scoping of the SDEIS which, we think, is woefully inadequate in that it does not perform the alternatives analysis that is required by the law and the regulations on this topic. (0072 0082-3)

Response: *FTA, the lead Federal agency, DRPT and WMATA regard the Project to be the 23-mile Full LPA that will have two construction phases. Therefore, the Project Team with FTA and in cooperation with FAA has properly prepared the Draft EIS, Supplemental Draft EIS and Final EIS in accordance with the provisions of the National Environmental Policy Act (NEPA), as amended.*

13.0 PROJECT IMPLEMENTATION

13.1 Schedule/Process for Implementation

A. Draft EIS Comments

Regional Agency Comments

Public Private Partnerships

Regional Comment: The Commonwealth should place the design and construction of the preferred alternative in the hands of a Virginia PPTA. Then the best possible cost practices can be applied to blend vision and new thinking with the best of the existing WMATA rail system. (0133, 0221-M –2)

Regional Comment: We believe the Commonwealth should place the design and construction of the preferred alternative in the hands of the Virginia PPTA, the goal being to marry the best possible cost practices with vision and new thinking, with the best of the existing WMATA rail system. (0133, 0133-T – 2)

Regional Comment: To optimize ridership and to reduce the long-term subsidy burden, Virginia should contract with a highly qualified private sector or PPTA team to design, construct, and if at all possible, operate the Dulles Corridor rail system. (0133, 0405- L-14)

> ***Response:*** *On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. The benefits of PPTA for this project are explained at DRPT's web site, www.drpt.virginia.gov.*

Local Agency Comments

Estimated Dates for Implementation

Local Comment: We understand that the state is negotiating with the private sector team, Dulles Transit Partners, to create a public private partnership to engineer and construct the project. We are excited at this opportunity for the private sector to participate and look forward to a design-build process that provides the opportunity to bring rail out to the corridor in advance of the projected 2010 completion date. (0233, 0426-M –36)

Local Comment: Implement the Metrorail alternative as soon as legally and financially feasible, with strong consideration to provide immediate service through the Corridor to Dulles Airport, given it is the most cost-effective option to best serve Hunter Mill residents and businesses. (0437, 0437-E –5)

Local Comment: Immediately begin to implement additional enhancements to the rapid express bus service in the Corridor as interim service prior to Metrorail. (0437, 0437-E –6)

> ***Response:*** *The assumed opening years of the two Build Alternatives of the Final EIS are 2011 for the Wiehle Avenue Extension and 2015 for the Full LPA. The opening years are based on the likely availability of federal and non-federal funding for the project, timely FTA approval to enter final design, timely completion of FFGA negotiations, timely execution of the FFGA and the use of PPTA to procure the design/build contract.*
>
> *The availability of funding will have an impact on the implementation schedule for the two phases of the Full LPA. There are many New Starts projects across the nation that are competing for federal funding, and the Federal Transit Administration may not be able to commit funding in the*

amount needed to meet the schedule. Likewise, there are other transportation needs in the Commonwealth, Fairfax and Loudoun Counties, and at Dulles International Airport, all of which require funding to complete, and the non-federal funding partners may not be able to commit the funds needed to meet the aggressive schedule of the Full LPA. DRPT could choose to finance the funding shortfall but this would increase the capital cost of the Full LPA significantly.

DRPT and WMATA have determined that this project, if advanced, should be constructed using the design/build method. This method has been used successfully on other recent major transit projects and can save time because the owner does not have to first advertise for design contracts, and then advertise for construction contracts after the design is complete. On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. The benefits of PPTA for this project are explained at DRPT's web site, www.drpt.virginia.gov

Local Comment: Neither is a secret public-private partnership an option, the details of which are negotiated behind closed doors and without meaningful citizen involvement but which stick taxpayers with increased payments-- in this case higher tolls on the Dulles Toll Road. (0151, 0297-E –4)

Response: *On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. A copy of the Comprehensive Agreement is available at DRPT's web site, www.drpt.virginia.gov.*

Need to Identify Construction Staging Areas

Local Comment: It is understood that significant portions of construction will be confined to the current Dulles Access and Toll Road corridor. As such many of the attached recommendations will be irrelevant to this project. However, they are provided with the understanding that with projects of this nature construction staging areas are often used outside the right-of-way. Often these do not appear on the construction plans and requests for comment but should be treated as a part of the construction. (0306, 0306-A –7)

Response: *The Final EIS and the final General Plans evaluate and depict potential contractor work areas.*

Public Comments

Estimated Dates of Implementation

Public Comment: I want to know what year we can expect it to be completed. No more "maybe 2010, maybe 2017…". Even a range of 2-3 years is fine. Of course the sooner the better. (0114, 0114-E –3)

Public Comment: Think about it. We are not much like the metropolitan area we were 30 years ago. Most of us don't have to go into D.C. to work, live, or play. We do it here in Tysons, in Reston, in Bethesda, or other areas. We are not a collection of bedroom communities. We are cities in our own right, very different from the vision of metrorail which was really designed to bring people from the suburbs to the city. So the question, how do we solve our commuting nightmares that we face now? The EIS states that metrorail will be in operation by 2010, but it's more likely that the system wouldn't begin operations out to Dulles until at least 2015. (0183, 0183-T –2)

Public Comment: Finally, I hope that the project will move forward expeditiously. I am willing to pay my fair share of the cost through increases in toll road fees, a local sales tax increase, and by other appropriate means. (0194, 0216-M –4)

Public Comment: Metrorail service should begin as quickly as technically possible. Operational segments should come on line as they are completed rather than wait for the entire line to be finished. Service to Tysons could be opened in 2006; to Reston 2007 and to Dulles 2010. If for some reason service through Tysons threatens to delay implementation of service to the rest of the corridor, something akin to the old alternative T-8 should be implemented. This would provide rail service straight down the median of the Dulles Corridor to the rest of the corridor while the issues and construction of the Tysons' stations are settled. Actually, the inclusion of service down the full length of the corridor using the median might be desirable in any case. It would permit an alternate route that may be operationally worthwhile. (0208, 0208-M –3)

Public Comment: The members of the board of directors of LEADER are committed to putting their resources and their position in the region on the line to make Dulles rail a reality. The only thing they ask in return is that delays in this project be minimized and that the ultimate product serves the most people possible. When one thinks about future growth in the Dulles corridor, realizing that over the next 20 yrs. The volume on the already congested toll road could double and reflecting on how long it has taken for this project to reach this stage, the urgency of moving to rail as quickly as possible becomes clear. (0154, 0154-T –4)

Public Comment: Suggest development of a strategy for rail that takes advantage of interest in rail to Tysons as soon as is feasible but no later than 2010 and rail throughout the rest of the corridor to Loudoun as soon as financing can be secured from the federal government. The strategy should provide the ability to implement transit enhancements in the corridor beyond the baseline until rail can be provided. The strategy should examine the benefits -- if any --- of providing rail transit in the Reston-Herndon-Dulles-Loudoun section in a way that allows a few stations to be built initially concurrently with the Tysons section to provide service to Washington-Dulles International Airport as soon as possible and allow for the construction of fill-in stations on a different schedule. The related costs for this strategy should be examined prior to finalizing the EIS. (0396, 0396-L –3)

Public Comment: Also, when you prepare the Final Environmental Impact Statement, you should be a bit more realistic in your time schedule. The current schedule is overly optimistic at best, especially when it comes to funding the project. In relation to the time schedule, I did read one comment by someone who either spoke at a hearing or wrote to one of the local papers. This person asked why the "pure" rail option(s) in the Draft EIS did not include a recommendation, or option, that construction would start at both ends, as was done with the Transcontinental Railroad back in the mid-1800's. Surely this would speed up completion? (0401, 0401- L-7)

Public Comment: Finally, BRT could be up and running in less than two years, with improvements such as additional dedicated right-of-way built over time. Metrorail, even under the most optimistic projections, will not be operational for nearly a decade. (0444, 0444-E –5)

Public Comment: Also, when you prepare the Final Environmental Impact Statement, you should be a bit more realistic in your time schedule. The current schedule is overly optimistic at best, especially when it comes to funding the project. In relation to the time schedule, I did read one comment by someone who either spoke at a hearing or wrote to one of the local papers. This person asked why the "pure" rail option(s) in the Draft EIS did not include a recommendation, or option, that construction would start at both ends, as was done with the Transcontinental Railroad back in the mid-1800's. Surely this would speed up completion? (0401, 0401- L-7)

> ***Response:*** *The assumed opening years of the two Build Alternatives of the Final EIS are 2011 for the Wiehle Avenue Extension and 2015 for the Full LPA. The opening years are based on the likely availability of federal and non-federal funding for the project, timely FTA approval to enter final design, timely completion of FFGA negotiations, timely execution of the FFGA and the use of PPTA to procure the design/build contract.*

The availability of funding will have an impact on the implementation schedule for the two phases of the Full LPA. There are many New Starts projects across the nation that are competing for federal funding, and the Federal Transit Administration may not be able to commit funding in the amount needed to meet the schedule. Likewise, there are other transportation needs in the Commonwealth, Fairfax and Loudoun Counties, and at Dulles International Airport, all of which require funding to complete, and the non-federal funding partners may not be able to commit the funds needed to meet the aggressive schedule of the Full LPA. DRPT could choose to finance the funding shortfall but this would increase the capital cost of the Full LPA significantly.

DRPT and WMATA have determined that this project, if advanced, should be constructed using the design/build method. This method has been used successfully on other recent major transit projects and can save time because the owner does not have to first advertise for design contracts, and then advertise for construction contracts after the design is complete. On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. During preliminary engineering, DRPT and WMATA will determine proposed construction sequence.

Public Comment: To those of you that have the power to make something happen, you need to be looking at the entire picture not just the political aspects of this. You have to consider all the states, Maryland, Virginia, West Virginia and Washington, D.C. Commuters come from all these states and district, crossing over into each of these areas daily to reach their places of employment. You all have to work together because this affects everyone. We can't wait until 2010 or 2015 for some kind of transit system to be completed to find relief, we need something now. We can't wait another 30 years for maybe something to be done. Instead of hearing some really serious ideas, all we hear is more politics. And as a result nothing will ever be done. I am presently 55 years old and I dare to say I will never see anything productive happen in my lifetime. (0123, 0123-L –4)

Response: *The Dulles Corridor Rapid Transit Project is being planned in the context of the regional transportation system for the entire Washington metropolitan area. As part of the Metropolitan Washington Council of Government's (MWCOG) long-range plan, the project is an integral part of the planned regional transportation network. The Dulles Corridor Rapid Transit Project is expected to attract many patrons who are not currently transit riders, many of whom will come from outside the immediate corridor.*

The assumed opening years of the two Build Alternatives of the Final EIS are 2011 for the Wiehle Avenue Extension and 2015 for the Full LPA. The opening years are based on the likely availability of federal and non-federal funding for the project, timely FTA approval to enter final design, timely completion of FFGA negotiations, timely execution of the FFGA and the use of PPTA to procure the design/build contract.

Public Comment: What justifies waiting seven to 15 years longer for metrorail to start service to Dulles and Loudoun than it will take to get the BRT in operation? (0138, 0241-T –3)

Response: *BRT would have been much easier to implement. Its vehicles would have run on existing highway lanes. Metrorail will be more complicated to construct and requires a dedicated right-of-way, the construction of aerial, at-grade, and underground guideway, stations, yards and ancillary facilities. However, the BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Addressing the Needs of Commuters and Tourists

Public Comment: The plans are completed. The right of way was wisely put in the Dulles Corridor when built. We should make it a matter of national and regional and local priority to get this line built within

several years at most. It is a national disgrace that a person arriving at our capital city's main international airport cannot take a metro-train into Washington D.C.; and it is a national disgrace if we can not fix this in a matter of years (at most). (0083, 0083-CC-1)

> ***Response**: Providing direct service to Dulles International Airport is a key goal of this project, and is included in the project's Purpose and Need.*
>
> *The right-of-way for the project is largely in place in the median of the Dulles Connector Road, the Dulles International Airport Access Highway, at Dulles International Airport, and in the Dulles Greenway. There is, however, additional right-of-way that must be procured for stations and parking areas, for the service and inspection yard, and for portions of the alignment in Tysons Corner. Procuring this right-of-way must be accomplished in accordance with federal and Commonwealth laws.*
>
> *The assumed opening years of the two Build Alternatives of the Final EIS are 2011 for the Wiehle Avenue Extension and 2015 for the Full LPA. The opening years are based on the likely availability of federal and non-federal funding for the project, timely FTA approval to enter final design, timely completion of FFGA negotiations, timely execution of the FFGA and the use of PPTA to procure the design/build contract.*

Recommendation for Architectural Firms

Public Comment: I am a resident of Fairfax, VA and unfortunately I could not make the time to come to the recent meetings but I'm sending in my comments that Foster & Partners, Wilkinson-Eyer or Alsop & Stormer architectural firms should be chosen as candidates for extension project into Dulles Airport. They are world renowned for their work and recently worked on the 5 billion dollar extension of London's Jubilee Line. (0113, 0113-E –1)

> ***Response**: On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. The firms that you mentioned are welcome to submit proposals to Dulles Transit Partners.*

Need to Comply with the Americans with Disabilities Act

Public Comment: We also need to have expanded curb-to-curb paratransit system as part of being able to get into the neighborhood so people with disabilities and persons who do not drive can access the terminal station that is proposed, or any other station within the rapid transit project. (0259, 0259-T –4)

> ***Response:** MetroAccess currently serves the Dulles Corridor and should be available upon the opening of the Metrorail Extension. MetroAccess provides curb-to-curb transportation service for eligible riders. MetroAccess operates service to any location in the District of Columbia; to Montgomery and Prince George's counties in Maryland; and to Arlington and Fairfax counties, the cities of Alexandria, Fairfax and Falls Church in Virginia that is within three-quarters of a mile of any fixed-route service operated by Metrorail, Metrobus or any of the above local jurisdictions. MetroAccess provides service during the same hours and on the same days as does regular fixed-route service. All stations will comply with the Americans with Disabilities Act.*

Public Private Partnerships

Public Comment: We request that all financial arrangements between any member of the study team, the public private partnership, WMATA, campaign and coordinating officials, consultants, and any of the groups who comment on this study be made available within the next month. (0162, 0162-M –20

Public Comment: And, finally, are our elected officials willing to hand over the development and financing responsibilities to private people that are not subject to the same decision making transparency and public hearing process as public agencies are and not required to do a Federal environmental impact statement and are expecting to make a profit on this endeavor that may necessarily increase the profit costs? (0181, 0181-T –9)

Public Comment: We request financial arrangements between members of the study team, public-private partnership, WMATA, et cetera, be made completely public so we may study the interrelations. (0184, 0184-T –17)

> ***Response:*** *On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. A copy of the Comprehensive Agreement is available at DRPT's web site, www.drpt.virginia.gov.*
>
> *There are no financial relationships between the WMATA consultants who prepared the Final EIS and the firms that comprise Dulles Transit Partners. In addition, there is no financial or contractual relationship between WMATA and Dulles Transit Partners.*

Public Comment: We want to know if the sponsorship of the current public-private partnership will wish to continue with a final choice of bus rapid transit combined with private transit, with no firm commitment to the wasteful extension of rail beyond Tysons Corner, which we might call Amtrak to Dulles. We are not sure that the present team wants to do that. (0184, 0184-T –8)

> ***Response:*** *After the public and interagency review and comment on the Draft EIS, in November and December 2002, the WMATA Board of Directors and the Commonwealth Transportation Board respectively selected the Metrorail Build Alternative as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Build Alternatives were eliminated from further consideration.*
>
> *On June 11, 2004, DRPT signed a Public-Private Transportation Act (PPTA) Comprehensive Agreement with Dulles Transit Partners, a partnership of Bechtel Corporation and Washington Group International, to engineer, design and build the for the Full LPA, a 23-mile Metrorail extension. A copy of the Comprehensive Agreement is available at DRPT's web site, www.drpt.virginia.gov.*
>
> *The selection of the LPA and the execution of the PPTA comprehensive agreement were separate acts that followed separate processes.*

B. Supplemental Draft EIS Comments

Local Agency Comments

Land Use Forecast

Local Comment: While 2025 as a forecast horizon year for the Draft EIS may have been appropriate, County staff do not feel this is the case for the Supplemental Draft EIS. The Draft EIS did not anticipate the Locally Preferred Alternative being developed in two phases. Additionally, the Draft EIS anticipates the Locally Preferred Alternative being operational in 2010. The Supplemental Draft EIS anticipates the Locally Preferred Alternative being developed in two phases with phase 2 being operational in 2015. County staff believes that these differences necessitate that a different forecast horizon be used when evaluating the alternatives in the Supplemental Draft EIS**.** (0084 13-1)

> ***Response:*** *The Project Team has used the Metropolitan Washington Council of Government's (MWCOG) Cooperative Land Use Forecasts - Round 6.3, which does have a later forecast year*

of 2030. However, to remain consistent with past NEPA analyses and results that are documented in the Draft EIS and Supplemental Draft EIS, the Team will retain a forecast year of 2025 for the analyses in support of the Final EIS.

Public Comments

Mitigation Plan and Monitoring is Needed

Public Comment: A mitigation plan, ongoing monitoring of the effectiveness of mitigation measures and an independent managing entity of stakeholders, including community representatives, to oversee and monitor implementation of the mitigation plan to ensure agencies comply with their mitigation responsibilities. (0087 0102-11) (0089 0104-11) (0099 0115-11) (0104 0121-9)

Public Comment: A mitigation plan be included in the final EIS to designate the specific mitigation responsibilities of each agency (to include ongoing monitoring to evaluate the effectiveness of mitigation measures), along with cost share and implementation timeline. (0026 0027-17)

Public Comment: A managing entity be designated to coordinate implementation of the mitigation plan and to ensure that individual agencies comply with their mitigation responsibilities by monitoring implementation of mitigation measures and reporting to stakeholders. This managing entity should include representatives of transit and transportation agencies and stakeholders such as property owners and tenants, civic associations, and elected officials. (0026 0027-18)

Response: *DRPT, the project sponsor, will prepare, implement and monitor a mitigation plan, based on the mitigation commitments in the FTA Record of Decision. A summary of proposed mitigation measures is provided in Chapter 2 of the Final EIS. FTA and the state agency responsible for a particular resource area will monitor the effectiveness of the mitigation measures implemented to offset the Project's adverse effects.*

S.0 EXECUTIVE SUMMARY

A. Draft EIS Comments

State Agency Comments

Need for Further Explanation of Environmental Effects

State Comment: Pg S-27, 4th paragraph. (Summary, Environmental Effects) - Next to the discussion for secondary effects of increased development at transit stations, the sidebar comments (right margin) states one of the potential positive effects as being "Reduction in traffic congestion". By itself this statement appears counter-intuitive (you would expect more traffic congestion caused by increased development, as only a portion of new trips are captured by transit). Suggest the margin comment be further explained, such as by "Potential positive effects of concentrated vs. more spread out development". (0421, 0421-A –14)

> ***Response:*** *In the Executive Summary of the Final EIS, the Project Team has replaced the bullet with one that reads '- Enhanced mobility'.*

Public Comments

Use of Photographs to Illustrate Conditions

Public Comment: Even your literature for the unsuspecting public is deceptive, seeking to portray rail as a panacea for alleviating congestion, air pollution and "sprawl." The photos of a congested freeway on page 2 of the slick-four-color "Executive Summary" with a rail station superimposed at Tysons showing a near empty Route 7 in the background is one such example. (See Exhibit 5). Another example (Page S-32) shows a congested freeway captioned: "Dulles Connector Road." That is not correct. This is a photograph of the northbound lanes of VA 123 (an arterial highway, not an access controlled facility such as the Dulles Connector) as it crosses under I-495. (Exhibit 6). (0112, 0462-L –29)

> ***Response:*** *The photographs referenced were not intended to mislead the public. Rather they were meant to communicate that the Dulles Corridor Rapid Transit Project is intended to provide mobility benefits to users. The Executive Summary of the Final EIS does not use the photographic simulation or the photograph that this comment addresses.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

GENERAL PLANS

A. Draft EIS Comments

State Agency Comments

Design Considerations

State Comment: Comments below apply to most sheets in a series but have been identified at sheet first encountered.
[a]* Sheet 015 L1 Alignment - Cross over location at 1910+00 is pushing curve out at sta. 1900+00 and will require significant roadway work due to overlap. Can this cross over location be shifted?
[b]* Sheet 103 Sta. 1869+00 Most of gore as loop meets EB Dulles Greenway will need to be reconstructed. Match line likely further back.
[c]* Sheet 019 Sta. 1820+00 1815+00 Can curve be made shallower (increase radius) shifting rail station 1810+00 slightly South East to avoid reconstruction of WB Dulles Greenway.
[d]* Sheet 026/30 – Sta. 1782+00 has a possible SWM pond located in off ramp gore. This would be an un-ideal location as potential hazard to vehicles leaving the road. Would alternate site be available to the southeast of the ramp or further north?
[e]* Sheet 30 - what is clearance from rail structure to shoulders may require roadway widening (bow out) as 6th lane continues in this area. The relatively flat skew at 1757+00 will require a relatively large span bridge does vertical alignment allow for required structural depth and clearance over roadway?
[f]* Sheet 42 - Sta 1480+00 SWM pond widened - evaluate need if further guard rail is required due to proximity of hazard to road. Provide access from Worldgate Dr.
[g]* Sheet 43 - Will pedestrian bridge have adequate clearance over Herndon Park and Ride Ramp Structure?
[h]* Sheet 43/44 - Sta. 1440+00 skew of station results need to rebuild EB DAAR - Can different skew or shallower curve/transit be used to stay within existing DAAR bubble and lessen impacts?
[I]* Sheet 44 - Extend guardrail along ramp to protect TBS/RTC
[j]* Sheet 50 - 1275+00 SWM/BMP protect with guard rail - how will it be accessed or maintained? 1260+00 SWM/BMP will it be maintained / accessed from Sunset Hills?
[k]* Sheet 51 Sta. 1232+00 SW quadrants SWM pond - Coordinate will VDOT Hunter Mill Road Project. May result in joint pond within Loop.
[l]* Sheet 56 - Sta. 1090+00 to 1080+00 drafting issue show the rail alignment within the median. If shoulder really needed to be rebuilt, indicate on other plans.
[m]* Sheet 57 - Configure SWM pond sta. 1061+0 to avoid rebuilding shoulder and guardrail on WB DTR
[n]* Sheet 58 - Sta. 1030+00 structure is spanning loop ramp, a more relaxed curve could allow column placement in area between DTR/outer ramp and loop. This would also pull column out of gore Sta. 1026+00 where it presents a hazard. This might only be achievable if cross over location is moved.
[o]* For Tysons Corner area please incorporate comments made during co-location study.
[p]* Sheet 059 Frontage Road should be maintained between Westwood and Spring Hill Road. Ramp or CD road may some day tie into frontage road system.
[q]* Sheet 060 at Sta. 980+00 Verify that frontage road lane shift at portal meet min. standard.
[r]* Sheet 061 Sta. 946+00 Verify that underground rail (any alternative) is below any interchange configuration with International Drive below Chainbridge Road with Chainbridge Road at present day elevation.
[s]* Sheet 64 Sta. 880+00 - Can curve be modified to avoid column near ramp gore or in Rte. 123 shoulder? Possibly shift to North side of 123.
[t]* Sheet 78 Sta. 980+00 - Ensure TPSS 5 is sufficiently below grade so that interchange configurations shown in Tysons co-location study are not effected or impacted.
[u]* Sheet 79 Station 969+00 - Is blocked out area offset not to impact Route 123/7 configurations shown in Tyson's Co-location study. Move EA out of loop ramp.
[v]* Sheet 82 - See comments for sheet 58
[w]* Sheet 85 - Ensure rail structure is sufficiently below grade to not impact Interchange at Rte. 123/International Drive if Chain Bridge Road Is maintained at present grade. This may be a more stringent requirement than shown in the Co-location Study. Any lack of clearance should be resolved prior

to any construction.
[x]* Sheet 87 - Is Old Spring House Road being realigned or modified?
[y]* Sheet 88 - See comments for Sheet 64
[z]* Over all "T-9 Design Option" with adequate vertical clearances is the alignment that impacts existing and potential future highway improvements the least, while meeting railway over-all objectives. (0421, 0421-A –35)

Response: *The Project Team prepared the following responses and revised the General Plans where noted. References to specific drawings reflect the Final EIS final General Plans unless otherwise noted.*

[a] The crossover location as shown is based on operational requirements for a terminal station. It was placed in one of the few tangent areas available in the median where impacts to the adjacent Greenway could be minimized. (GPN-PP-002)

[*b] Ramp adjustments, including the precise location of the transition between new and existing pavement in the ramp and gore areas, will be addressed during the preliminary engineering phase. (GPN-PP-003)*

[c] The current alignment as designed minimizes the reconstruction to the WB Dulles Greenway. Increasing the radius as suggested would impact the EB Dulles Greenway east of the Route 606 station. This alignment will be further studied in preliminary engineering to assess whether the impacts to the WB Greenway can be further reduced. (GPN-PP-009)

[d] The topographic mapping for this area shows this corner as the lowest point in the quadrant, which would make it suitable for a pond because runoff drains to this point already. The possibility of relocating the pond north will be evaluated during preliminary engineering phase. All adjacent roads will be protected from ponds in accordance with federal and VDOT standards for roadside barrier protection. (GPN-PP-010)

[e] Sheet 118 currently shows approximately 18' of clearance (more than the 16'-6" minimum) over the lanes of the EB Greenway with a structure depth of approximately 9' from top of rail. All clearances will meet VDOT design criteria. (GPN-PP-011)

[f] This is an existing pond that is in operation. If the drainage analysis during the preliminary engineering phase indicates a need for additional stormwater detention capacity, modifications will be included. Access and guardrail protection will be designed during preliminary engineering in accordance with federal and VDOT standards for roadside barrier protection. (GPN-PP-026)

[g] As indicated in the General Plans (the pedestrian bridge will provide 17'-0" of clearance over the existing ramp. (GPN-A-300-HM)

[h] Several options were examined for the Herndon-Monroe Station location and the adjacent track alignment. Of the alignments studied, the current design has the least overall impacts to the DIAAH and adjacent bridge structures. Efforts will be made during preliminary engineering to minimize relocations of the DIAAH in either direction. (GPN-PP-027)

[I] Guardrail placement will be designed during preliminary engineering in accordance with federal and VDOT standards for roadside protection. (GPN-PP-028)

[j] Guardrail placement will be addressed during the preliminary engineering phase. Proposed pond locations throughout the corridor must also be subjected to further analysis during preliminary engineering. If this pond remains at its current location, efforts may be made to obtain access for pond maintenance through the adjacent parking lot. (GPN-PP-033) The pond at STA 1260+00 may have its access through the wide cleared swath of the existing woods. (GPN-PP-034)

[k] The General Plans show approximate sizes, configurations, and locations for all stormwater management facilities. The locations are based on optimum conditions and must be analyzed further during the preliminary engineering phase of the Project, when other factors, including co-location with planned or existing facilities, will be taken into account before final placement of stormwater management facilities. (GPN-PP-035)

[l] Refer to drawing GPN-PP-042 for a more accurate depiction of the alignment relative to the median in this area.

[m] Refer to drawing GPN-PP-043 for a more accurate depiction of the pond. The General Plans show approximate sizes, configuration, and locations for all stormwater management facilities. During the preliminary engineering phase of work, configurations will be developed that minimize or eliminate conflicts with other facilities.

[n] Based on column spacing of approximately 100 to 120 feet, it appears that columns supporting the proposed aerial structure could be located outside of the immediate gore area. Column placement will be examined in more detail during preliminary engineering. The pocket track as shown on the plans cannot be relocated because this would affect the proposed location of the Tysons West station. (GPN-PP-044)

[o] The designs for the various alignment options in Tysons Corner reflected comments incorporated during the VDOT co-location study. To the knowledge of the Project Team, the LPA in Tysons Corner neither precludes nor accommodates the proposed roadway improvements of the co-location study. Additional coordination with VDOT will continue during preliminary engineering to resolve any outstanding issues with co-location.

[p] Maintaining the current frontage road system was a design assumption for all alignment options and will be carried through the preliminary engineering phase for the selected LPA. (GPN-PP-046)

[q] All relocated frontage roads will be designed to meet all applicable VDOT or Fairfax County design criteria. (GPN-S-011)

[r] The LPA Alignment T6 does not preclude a future grade separation of International Drive and Route 123. (GPN-PP-050 & 051)

[s] As part of the Supplemental Draft EIS and revised General Plans, the Project Team eliminated a pocket track east of Tysons East Station and realigned the oblique aerial crossing of Route 123 in order to reduce the costs and visual effects of a complex crossing. The result is that the horizontal alignment is no longer in the referenced gore area. Column placement will be examined in more detail during preliminary engineering. Efforts will be made to locate columns to minimize or eliminate impacts to existing facilities. (GPN-PP-056)

[t] An underground traction power substation in an underground section of Metrorail would typically be located above the Metrorail tracks so that work trains might deliver replacement equipment. Since TPSS 5 in that type of location would likely conflict with the proposed Route 7 interchange with Westpark Drive, the location and configuration of underground TPSS 5 will be adjusted as necessary during the preliminary engineering. (GPN-PP-103)

[u] The current location of the surface South Entrance Pavilion for Tysons Central 7 Station will be examined in more detail during the preliminary engineering phase and may be relocated further west to avoid any conflicts with proposed Route 7 / Route 123 interchange improvements. Final location of emergency access (EA) shafts will be addressed during preliminary engineering phase. EA requirements specify that their location be adjacent to (but not below) a roadway or parking area to allow access for fire and rescue vehicles. (GPN-PP-050)

[v] Column placement will be examined in more detail during preliminary engineering. It appears that columns could be located outside of the gore area without significant changes to alignment geometry. (GPN-PP-044)

[w] The LPA Alignment T6 does not preclude a future grade separation of International Drive and Route 123. (GPN-PP-050 & 051)

[x] Yes, Old Spring House Road is being realigned in accordance with Capital One development plans, such that the Tysons East Station does not straddle the roadway. (GPN-A-100-TE)

[y] See response(s) above.

[z] Alignment T9 and T9 Design Option were eliminated from consideration after the agency and public review and comment period on the Draft EIS.

State Comment: Station at Route 28 Stop has a proposed overpass by others shown with no tie into North Green Drive. Given that this road bisects the development and parking of the South Station and will profoundly affect entrance to North Station, there needs to be an agreement by builder of over pass prior to the construction of these stations and the dedication of right of way (0421, 0421-A –24)

Response: *The Project Team agrees that the alignment, associated right-of-way, and construction schedule for this overpass must be resolved as preliminary engineering advances. The lead agency for this effort is Fairfax County, which has identified this overpass within its Comprehensive Plan.*

State Comment: Sheet 774, Tysons West Station - The frontage road between Westwood Center Drive and Spring Hill Road needs to be available for the frontage road system. (0421, 0421-A –27)

Response: *The station, guideway, and their structural supports will be designed to maintain the roadway cited in this comment.(GPN-A-300 & 301-TW)*

State Comment: Sheet 796 - Do the Pedestrian Tunnels conflict with a depressed Route 7 that would be needed with 7/123 Interchange modifications per the co-location study? (0421, 0421-A –28)

Response: *Based on the information available in the VDOT co-location study, the overall plan is considered feasible without affecting the referenced roadway. During preliminary engineering, the configuration of the station and entrances will be refined and coordinated with VDOT. (GPN-A-300-T7)*

Regional Agency Comments

Design Considerations for Traction Power Substation

Regional Comment: DEIS Figure 2.3-15 indicates the potential location of four traction power substations on airport property. Although it appears that two of these would be located in the north airport, one would be in the vicinity of the Main Terminal and one along the DIAAH. In both these locations, the site selection and facility design will need to take into account potential visual impact on views of the Main Terminal complex and the architectural character of the historic district. It is anticipated that the MWAA Design Manual would dictate the design treatment in order to assure compatibility with the airport's other service structures. (0440, 0440-A –8)

Response: *The locations of the planned Traction Power Substations (TPSS) are preliminary. Substation enclosure designs will be further developed during preliminary engineering. The enclosure design will be context-sensitive and will take into account MWAA design criteria for facilities on Airport property.*

Public Comments

Dulles International Airport Access Highway (DIAAH) Relocation

Public Comment: GPN-PP-032 and Others When the new lanes on the Toll Road were added several years ago, the planning for the stations at Wiehle Avenue and Herndon assumed stations with 36.83 foot track centers. Confirm that the DAAR be relocated without relocating the Toll Road? (0387, 0387-L –21)

Response: *Current WMATA standards require a 30'-6" wide platform (40'-6" track centers). The increased platform width improves access for disabled patrons. The required DIAAH relocations in the corridor can be constructed without relocating the Dulles Toll Road (DTR) at the Wiehle Avenue and Reston Parkway Stations. When the future widening of the DIAAH to six lanes occurs, the DTR would need to be relocated at the Route 28 and Herndon-Monroe Stations.*

Tysons Corner Alignment Considerations

Public Comment: GPN-PP-046 T1 Alignment and Others Since the Tysons West Station will likely be a terminal station for some time, the plan should be amended to include a double x-over inbound of the station to facilitate turnback movements. With a x-over in front of the station, the turnback time can be

reduced from approximately 6 minutes to two minutes or less. This quicker turnback time will be critical to provide the necessary flexibility to ensure that the Dulles service can merge with the Orange Line service at West Falls Church and the Blue Line at Rosslyn without interfering with scheduled service on either of these two lines. (0387, 0387-L –22)

> ***Response:*** *The LPA includes Alignment T6 in Tysons Corner. Its rail geometry precludes a double cross-over inbound of the Tysons West Station. Moreover, because Wiehle Avenue Station will be the interim terminal station of the first phase of the LPA, no turnback function is necessary at Tysons West Station.*

Public Comment: GPN-PP-046 T1 Alignment and Others Again, since the Tysons West Station will likely be serving as a terminal point for some time or as a major interface point for Route 7 traffic after the line is extended west, it is critical that the surface facilities for this station be located on the same side of the street as the station in order to reduce the friction (and resulting ridership loss) associated with the mode transfer with the current configuration with the surface facilities on one side of Route 7 and the station platform on the other. It appears from the drawings that the best design would be to shift the station platform. (0387, 0387-L –23)

> ***Response:*** *During the Major Investment Study of the mid-1990's, the alignment through Tysons was originally located along the median of Route 7, but later placed on the west side at the request of VDOT to avoid conflicts with their proposed widening of Route 7, which will occur mostly on the east side. Moving the alignments to the east side would also significantly affect commercial properties, including the large Ernst and Young office building at the intersection of Route 7 and Westpark Drive. In addition, as shown in the final General Plans (Final EIS Volume V, GPN-A-100-TW), the distance between the platform and station facilities remains a reasonable walking distance.*

Public Comment: GP-N-050 and Others. While the structural sections show typical sections for Cut and Cover and Earth Tunnel sections, no where on these plans does it indicate which type of underground construction is proposed. The type of construction is important as the impacts and costs associated with each are quite different and thus should be addressed in the DEIS. But they're not. With some knowledge, one might be able to surmise which type is being proposed but some of the combinations of alignments and profiles don't make sense. For instance, GP-N-50 shows narrow track centers in the underground section which suggests cut and cover construction, but the profile on GP-N-51 is quite deep which suggests earth or NATM tunnel construction - or very expensive cut and cover construction. If the plan in this area for T1 is for cut and cover construction, the profile should be raised to more closely conform to the surface topography to reduce costs. (0387, 0387-L –24)

> ***Response:*** *The LPA includes Alignment T6 in Tysons Corner. The deep underground section of T6 will likely be mined tunnel while the underground Tysons Central 7 station will likely be cut-and-cover. The Final EIS states this approach and the capital cost estimate reflects these construction methods. A key factor that influenced the Team recommendation of T-6 was the interest of Fairfax County and VDOT to minimize the construction impacts on traffic in Tysons Corner. Cut-and-cover construction of the line section of T6 would affect the operations of both Route 7 and the Route 7/123 interchange.*

Public Comment: GPN-PP-153, 161. The narrow track centers at the Tysons East and West stations eliminate the pocket tracks at these stations and effectively preclude possible short line service that would terminate at these two stations. For that reason alone, T9 and any alternative that calls for stations with narrow track centers at these two stations should be eliminated from consideration. An alternative may be to utilize three track stations at these locations such as those at the National Airport and West Falls Church. (0387, 0387-L –25)

> ***Response:*** *The LPA includes Alignment T6 in Tysons Corner. Alignment T9 would have featured narrow track centers and side platforms, and as a result was the only alignment option of the Draft EIS that did not facilitate a pocket track outbound of Tysons West or inbound of Tysons*

East. The turnback movement, however, would have occurred at the interim terminal, Wiehle Avenue Station.

Public Comment: GPN-PP-157. T9 alternative eliminates the WB 7 to EB 123 ramp in the Route 7/123 interchange. The plan should indicate how this movement is to be replaced as it may involve additional impacts. (0387, 0387-L –26)

Public Comment: GPN-PP-179. T9 Design Option eliminates the Ramps in the northeast quadrant in the Route 7/123 interchange (WB 7 to WB 123 and WB 123 to EB and WB 7). The plan should indicate how these movements are to be replaced as additional impacts will most certainly result. (0387, 0387-L –27)

Response: *The LPA includes Alignment T6 in Tysons Corner. Alignment T9 was eliminated from consideration after the public and interagency review and comment on the Draft EIS. Roadway relocations and ramp improvement concepts proposed during the co-location study with VDOT are not shown on the final General Plans, since the co-location study has no confirmation and standing yet in regional and Commonwealth transportation plans. During preliminary engineering, final roadway modifications will be determined based upon existing conditions, but continuing coordination with VDOT will occur in regards to its study for a future configuration of the Route 7/Route 123 interchange.*

Public Comment: While I'm here today, I did want to focus on a couple of the issues in the Tysons Corner area. Engineering criteria have driven the location and the access facilities for much of the transit stations. I should say that we do support rail and rail now, as Ken Plum said. We support the alternative that would bring the most riders to Tysons Corner and that is the four-station alternative. We're not sure whether we should support the underground version or the aboveground version, but we do urge the county to do some serious urban design planning. I mean people talk about what it's like to cross over on a deck, but you could handle that quite nicely and be able to have buildings that linked up with an aerial structure maybe as well if not better than what you could do with underground tunnels going across Route 7. So we urge the county to follow up with access studies actually for all of the stations, but particularly in making this decision about how to handle the fourth station in Tysons Corner. (0141, 0141-T –4)

Response: *As indicated in the final General Plans (Final EIS Volume V), pedestrian access and connections are provided at each station that provide grade-separated access across Routes 7 and 123. The Project Team coordinated with Fairfax County planning staff, its Non-Motorized Transportation Committee, and VDOT to identify additional opportunities for pedestrian access to stations in Tysons Corner.*

Stormwater Management Facilities

Public Comment: Detention ponds should be designed as year-round landmark water features in the landscape (sub-urban or urban.). (0441, 0441-E –8)

Public Comment: The SWM/BMP Detention Ponds shown on and adjacent to our properties [Hunter Mill East], in addition to being unsightly, present an unnecessary health hazard. A recent study highlighted in the Washington Post found that over 80% of such facilities are mosquito breeding areas and represent a health threat to nearby homeowners, a matter of particular concern with the introduction of the West Nile Virus. (0464, 0464-L –1)

Response: *The design and location of all stormwater management ponds of the LPA will be further developed during preliminary engineering, and will conform to current state and local regulations. The Stormwater Management (SWM) ponds will be designed to provide detention of stormwater runoff, while the Best Management Practice (BMP) ponds will improve water quality while providing storm flow attenuation. Attempts will be made though landscaping and grading to blend the ponds into the natural environment. Concerns about safety and mosquitoes will guide design; it is unlikely that any of the ponds will have a permanent water surface level.*

Public Comment: A regional detention pond which protects Difficult Run was built "downstream" from these proposed ponds, making it more appropriate to participate in that existing facility, or to slightly enlarge it if necessary. (0464, 0464-L –2)

> ***Response:*** *The locations shown in the final General Plans of Best Management Practice (BMP) and Stormwater Management (SWM) ponds throughout the corridor are preliminary and were shown to illustrate a potential need based on current state and local regulations for one of these facilities somewhere in the vicinity of the location shown. During preliminary engineering, a comprehensive drainage study will be undertaken for the entire corridor to address final locations of all BMP and SWM ponds. The results of this effort should result in some facilities being eliminated, consolidated, or relocated to further minimize impacts to the adjacent areas. Enlarging a regional detention pond in the same watershed will certainly be considered as an option if capacity is available or expansion is feasible.*

Public Comment: An extensive and costly fertilizer management program was required of Golf Park by Fairfax County to allay the fears of homeowners on wells in the area regarding groundwater pollution. What types of pollutants do you anticipate seeping into the ground from the proposed SMN/BMP Detention Ponds? (0464, 0464-L –3)

> ***Response:*** *Properly designed, constructed, and maintained, Best Management Practice (BMP) ponds can effectively remove a wide range of pollutants from surface runoff and prevent them from being conveyed to receiving waterways. Pollutants such as metals, hydrocarbons, nutrients, and oxygen-demanding substances can be removed from the runoff and prevented from seeping into the adjacent groundwater by various measures, including the use of BMP ponds.*

Pedestrian Access to Stations

Public Comment: Revise the General Plans to reflect the Reston Charrette, by adding drawings showing compatibility. At a minimum, add options for access from the mezzanine levels to and across Wiehle and Reston Parkway. (0210, 0210-M –6)

Public Comment: Revise the general plans to reflect the Reston charette by adding drawings showing compatibility. At a minimum, add options for access from the mezzanine levels to and across Wiehle and Reston Parkway. Include pathways along the Toll Road between stations. We can begin now to make that area more bicycle and pedestrian-friendly. (0170, 0170-T –11)

> ***Response:*** *The Reston Charrette (held April 11 - 13, 2002, and organized by Fairfax County, the Northern Virginia Regional Commission, the Greater Reston Chamber of Commerce, and the Dulles Corridor Rail Association) resulted in multiple "alternative concepts," with no single, specific plan identified. As designed, the Wiehle Avenue and Reston Parkway stations do not preclude construction of access to adjacent roadway overpasses as suggested in this comment; however, at this time, no specific provisions are planned to accommodate it.*
>
> *Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP. The design of the Reston Parkway Station will be included in the continuing coordination with Fairfax County.*
>
> *Construction of pathways along the Dulles Toll Road are not within the scope of the Dulles Corridor Rapid Transit Project.*

Design Considerations for Traction Power Substation

Public Comment: Most notable, the location of the traction power substation (TPSS) would require the removal of approximately 11,667 gross square feet of office space based on current parking ratios of 3.0 spaces per 1,000 gross square feet in the existing 168,000 gross square foot building. This results in a reduction of approximately 7% of the office space due to lost parking. This is significant. The building to support the TPSS is likely 10 to 20 feet in height and the prominent location at the intersection will detract from the environment and potentially create sight distance issues at the intersection. (0477, 0477-L –19)

Public Comment: The T-4 alignments calls for a Traction Power Substation located on a portion of NADA's National Headquarters at 8400 Westpark Drive. The massive scale of this infrastructure component will become a visual blight and will eliminate much of NADA's parking capacity. (0477, 0477-L –2)

Public Comment: The proposed configuration of T-4 envisions locating a Traction Power Substation (Substation) on the eastern side of the Association's property at or near the entrance to the building off Westpark Drive. The building is 168,000 gross square feet and is located on a 6.088-acre parcel. The land and the improvements have an assessed value as of January 1, 2002 of nearly $16 million ($16,000,000) (0477, 0477-L –6)

Public Comment: Siting the Substation on NADA's property will reduce NADA's parking capacity by between 5 percent (5%) to 6 percent (6%). Under the applicable provisions of the Fairfax County zoning ordinance, this will reduce the Association's usable FAR and inconvenience tenants in its headquarters building. The Engineering Report states that the Substation "would require the removal of approximately 35 [parking] spaces. These spaces relate to and support approximately 11,667 gross square feet of office space based on current parking ratios of 3.0 spaces per 1,000 gross square feet in the existing 168,000 gross square foot building." Diminished parking will seriously undermine the Association's ability to retain and attract tenants. (0477, 0477-L –8)

Public Comment: As you may remember, the aesthetic police in Fairfax County jailed me for 98 days last year for not moving trees and shrubs to precise arbitrarily required locations on our property. Claiming it would be too "commercial", Fairfax County even denied us the zoning permits to build a nine hole Par 3 golf course on the land here where you are now proposing to build a large unsightly electrical boost station (TPSS 9). Your proposal is doubly ironic in that we were cited for a zoning violation for having a small electrical generator on the property which they deemed to be an unapproved use. (0464, 0464-L –4)

> ***Response:*** *As stated in Section 2.4 of the Final EIS, these ancillary facilities were sited based on systems engineering requirements and environmental and right-of-way constraints. In addition, a power analysis was conducted to determine the number and size of substations required and the optimal spacing for these stations. During preliminary engineering, efforts will be made to minimize impacts to the adjacent areas in terms of their access, architectural treatment, and landscape screening. Substation enclosure designs will be further developed. Individual sites will be taken into account, and enclosure design will be context-sensitive.*

Public Comment: The tax map numbers for the NADA Headquarters are 029-3-01-0061-A and -B. (0477, 0477-L –4)

> ***Response:*** *Alignment T4 in Tysons Corner was eliminated from further consideration after the public and interagency review and comment on the Draft EIS The properties in the above comment are no longer on the Project's Acquisition List.*

B. Supplemental Draft EIS Comments

Local Agency Comments

Further Information on Stormwater Management is needed

Local Comment: The County requests further information regarding proposed stormwater management measures for several of the station facilities (Wiehle Avenue; Tysons West; and Tysons East), as no such measures are identified on the proposed general plans for these facilities. (0083 0098-6)

Local Comment: Vol II, 79, 81, 86, etc. It is not clear if stormwater management measures are being proposed for several of the station facilities (e.g., Wiehle Avenue station facilities; Tysons West facilities; Tysons East facilities), as no such measures are identified on the site plans for these facilities. At a minimum, those facilities that will be provided within Fairfax County should include stormwater management and best management practice controls that are as effective as those required for private development projects. Project designers should also be encouraged to pursue low impact development (LID)/site design measures where appropriate (e.g., bioretention/biofiltration practices in parking lots) in order to reduce potential adverse impacts to streams. Many of the facilities identified in the documentation would lend themselves to such practices. (0093 0109-25)

> ***Response:*** *A comprehensive drainage analysis will be performed during preliminary engineering for the entire corridor. Adequate Stormwater Management (SMW) facilities will be provided at each station site and along the alignment in compliance with state, federal, and local SMW regulations. The latest techniques in water quality and SMW will be utilized.*

Need to Coordinate with Office of Site Development of Department of Public Works and Environmental Services on IDA and RPA Issues

Local Comment: The SDEIS states: "Amendments to the Chesapeake Bay Preservation Ordinance have been proposed by Fairfax County . . ." Amendments to the Ordinance were adopted by the Board of Supervisors on July 7, 2003 and became effective on November 18, 2003. The SDEIS suggests that Intensely Developed Areas (IDAs) would be designated; this has not been done. However, Resource Protection Area (RPA) designations have been revised, with the effect being that the extent of RPAs in Fairfax County has grown considerably (per a State requirement). Several of the proposed stormwater management facility sites (P-6, P-8, P-14, and P-17) are, or may be, located in "new" RPAs. In addition, one of the proposed tie breakers (B- 6) is in an area that has been mapped as a "new" RPA. The RPA designation would not necessarily preclude the construction of these facilities; however, exceptions allowing for these encroachments will need to be pursued and will probably require public hearings. It is noted that the tie breaker site and the site for the proposed pond P-14 are located in areas that have been subject to extensive disturbance. Coordination with the Office of Site Development Services of the Department of Public Works and Environmental Services (703-324-1720) is recommended. (0093 0109-19)

Local Comment: Env. Cond. Sheets - facilities associated with the Tysons East station will, in part, be located in a Resource Protection Area. In addition, an Environmental Quality Corridor has been identified on the site of the proposed Tysons East Kiss and Ride facility. A contractor work area is identified near the Tysons East station site; part of this site is located in the RPA. However, much of the RPA in this area has already been disturbed and is impervious in character. Coordination with the Office of Site Development Services is recommended as early in the process as possible to address possible Chesapeake Bay Preservation Ordinance issues associated with the station location, the Kiss and Ride facility, and the contractor work area. Project staff should also be encouraged to coordinate with DPZ to identify possible approaches to addressing the Environmental Quality Corridor in this area. (0093 0109-23)

> ***Response:*** *Thank you for the updated information on recently revised Resource Protection Areas (RPAs) and conservation easements. Coordination with Fairfax County staff will continue through*

preliminary engineering and final design. Locations of these facilities will be adjusted where required as the project's design is refined.

Sitting of Stormwater Retention Ponds

Local Comment: Page 6, Env. Cond. Sheets - Proposed stormwater management facility P9 is located in an area that has been established as a conservation easement. It is not clear if it would be feasible to construct a Stormwater management facility at this location. (0093 0109-24)

Response: *The proposed P9 facility location was adjusted to avoid impacts to the conservation easement. In general, locations of these facilities will be adjusted where required as the project's design is refined through preliminary engineering and final design.*

Local Comment: Gen. Plans - Ponds P-8 and P-9 (and others?) would be located on the other side of a noise barrier from the highway/rail. These ponds would not, therefore, appear to be able to collect drainage from the project site. Is this the case? Is the idea to establish compensatory controls? If so, what areas will go uncontrolled, and what will be the impacts on downstream water resources? (0093 0109-26)

Response: *A comprehensive drainage analysis will be performed during preliminary engineering that addresses runoff and storage in watersheds for the entire corridor. Adequate Stormwater Management (SWM) measures would handle any increased runoff caused by increases in impervious surfaces of the project. The ponds cited provide SMW for the increase in runoff from the line construction in the median. Runoff would be conveyed to the ponds via drainage pipes, and the ponds would provide storage that will regulate the flow back into the watershed.*

Concerns about the Location of the Contractor Work Area

Local Comment: Vol. II, p. 019 Tysons II development area may not be a realistic "contractor work area", as it will probably be developed prior to or during rail construction. Also, the area shown on this map does not match that shown in the SDEIS, Env. Conditions Sheet 3. (0093 0109-6)

Response: *In consultation with the owner/developer of these parcels during the public comment period of the Supplemental Draft EIS, it was determined that this area would be the last area developed as part of its master development plan, and it should be available as a contractor work area during at least a portion of the rail construction work for LPA Phase 1 prior to 2009 (the then opening year of the now-named Wiehle Avenue Extension). The Final EIS has reconciled the Environmental Conditions Map and the final General Plans. During preliminary engineering, DRPT and WMATA, in coordination with the two counties and VDOT, will determine the contractor work areas.*

Public Comments

Extend Underground Portion of Tysons Loop to Dulles Access/Dulles Toll Road

Public Comment: Equally importantly, we would strongly suggest that the Tysons Loop continue underground until it intersects with the Dulles Access/Dulles Toll Road. Indeed there remains a median in the Route 7 area from Springhill Road to the intersection with the Dulles Access Road/Dulles Toll Road. It is appropriate both to the existing businesses and to the existing transportation network to make this area as free of further congestion as practically possible. An underground extension of this Tysons Loop would make more sense, in all regards. (0004 0004-5)

Response: *The LPA includes Alignment T6 in Tysons Corner; Alignment T4 was eliminated from consideration after the public and interagency review and comment on the Draft EIS. The aerial section of the Alignment T6 was evaluated in the Final EIS for potential impacts. The analysis presented in Section 3.4 shows that aerial alignment would have moderate-to-substantial visual impacts in Tysons Corner. Because the elevated portions of Alignment T6 primarily extend along*

relatively wide roadways, the visual impact for these alignments would not be as substantial. In addition, Alignment T6 includes an underground section along Route 123 and Route 7, reducing the visual effects of this alignment. The most substantial visual effects would occur in the vicinity of the Tysons Central 123 Station, where landscaping would be removed and signage for the Tysons Galleria would be obscured.

Clarify Need for Retained Fill at Future Wolf Trap Station

Public Comment: The SDEIS needs to clarify the contention that a 1400-foot-long section of retained fill is needed to support tracks for accommodation of a future station at Wolf Trap National Park. (0068 0173-35)

Response: *The design of the Metrorail Alternative allows a future side-platform station at Wolf Trap by creating a level track grade along this segment of vertical alignment where the existing ground slopes significantly (3 to 4 percent). Fill and retaining walls up to 20 feet in height are required in the median of the Access Highway for the length cited to accommodate the transitions between the existing slope and the level station platforms. The additional cost is estimated at more than $5 million (YOE). The accommodation for a possible future station would not require any widening of the Dulles International Airport Access Highway or Dulles Toll Road, or require additional track. The future cost of a station at Wolf Trap would depend on the design of the station and the location of the stations support facilities (park-and-ride layout and size, access roads, pedestrian connections). No station design has been completed and therefore no corresponding cost estimate has been developed.*

Clarify Prior Realignment of Dulles Toll Road

Public Comment: The SDEIS needs to clarify the reference to the prior realignment of Dulles Toll Road and the Access Road to accommodate a transit station (at 2-22). (0068 0173-36)

Response: *Concurrent with the addition of HOV lanes to the Dulles Toll Road, portions of the Dulles Toll Road were modified to accommodate the Wiehle Avenue and Reston Parkway Stations. These "bubbles" of the Toll Road were created to allow these two stations to be built in the Access Highway median without impact to the Toll Road. The Access Highway must yet be bubbled at these two stations and at the Herndon-Monroe and Route 28 Stations. For the future six-lane Access Highway, the Toll Road would be bubbled at the Herndon-Monroe and Route 28 Stations. The three-track tail track of Wiehle Avenue Station as an interim terminal station does not appear to require additional bubbling of the Toll Road.*

Concerns with Siting of Infrastructure Facilities

Public Comment: The predominance of stormwater detention pond and substation locations away from Tysons Corner and Reston, as compared with the Hunter Mill-Wolftrap areas, needs to be objectively and adequately explained in detail in the SDEIS. Optically, at least, it looks like these infrastructure facilities are being sited away from commercial properties and to the detriment of residential and natural properties. (0068 0173-38)

Response: *Traction power substations (TPSS), tie-breaker stations (TBS), and Stormwater Management (SWM) ponds are located throughout the Corridor in order to support rail operations and the complete Project. No conscious effort was made to purposely locate these in residential areas to avoid affecting commercial areas. Efforts were made to locate these ancillary facilities in areas that minimize the disturbance to both adjacent residential and commercial properties. The distance between Metrorail station locations and power requirements dictate the locations of TPSS, while TBS are often located near special trackwork such as turnouts and crossovers. A more comprehensive drainage analysis will be performed during preliminary engineering.*

Clarify Proximity of Station/Tracks to Airport Facilities

Public Comment: The SDEIS fails to clarify how close tracks and a future station will be to the runway approach near Dulles Airport. Apparently, "approximately half" of an undefined "site" would be in the runway approach surface (SDEIS, 2-9). (0068 0173-9)

> ***Response:*** *The site plan for Yard 15 is shown in the General Plans (Final EIS Volume V, GPN-A-100-LY). The runway approach surfaces are shown, with all the occupied buildings being shown outside the surfaces. A portion of the yard lead tracks, some unoccupied buildings, and some vehicular parking are located within the approach surfaces, which is permitted by FAA regulations.*

Public Comment: Page 020/021. 1. We strongly object to consideration of Parcel 029-4-050010A (the Cleveland Site) as a "potential Contractor Work Area" because:
a. Such designation is tantamount to a condemnation by designation which would severely negatively impact the value of the property.
b. The Cleveland Site is currently under study for a rezoning application associated with additional density triggered by the FFGA. No one from WMATA has discussed the term the area would be used as a work area, compensation, indemnification from environmental liability, etc.
c. It appears there are other options for work areas other than a site ripe for redevelopment in conjunction with the opening of the Tysons East Station. (0113 0132-12) (0123 0158-14)

> ***Response:*** *The locations of areas identified as Potential Contractor Work Areas are preliminary, and their use will be based on their availability, the timing of plans for redevelopment, and the need for the site when the Project progresses into final design and construction. During preliminary engineering, DRPT and WMATA, in coordination with the two counties and VDOT, will determine the contractor work areas.*

Impacts of Aerial Easements

Public Comment: Permanent aerial easements are shown on the Cleveland Site which may impact zoning bulk regulations and land values. WMATA has not approached WEST*GROUP on the details of shown aerial easements and until details are known, we cannot concur with aerial easements shown. (0113 0132-17)

Public Comment: Permanent aerial easements are shown on the Cleveland Site which may impact zoning bulk regulations and land values. WMATA has not approached WEST*GROUP on the details of shown aerial easements and until details are known, we cannot concur with aerial easements shown. (0123 0158-19)

> ***Response:*** *Permanent aerial easements would be required for areas adjacent to elevated sections of the Metrorail guideway such as the aerial easement shown on the north side of Route 123. DRPT, the project sponsor and initial owner, can provide any requested information on the terms, conditions, and use restrictions of any potential easements. DRPT and WMATA will continue to coordinate with WEST*GROUP and other stakeholders as the project further develops during preliminary engineering, final design, and right-of-way acquisition.*

Utility Impacts at Station 900+00

Public Comment: At station 900+00 there is a new fiber optics telephone, gas and electric vault system that servers the entire CapOne project. You may have foundation conflicts in that area and/or the aerial track may impede access by utility companies. (0113 0132-21) (0123 0158-26)

> ***Response:*** *Thank you for the information. Comprehensive, as-built utility location will be assembled prior to the design of any foundations or substructures during the preliminary engineering phase of the project*.

Concerns about Facilities at the Tysons East Station

Public Comment: Figure 2.3.2. Tysons East Station seems to be overloaded with apparatus and equipment
Stations
· A tie-breaker (TB)
· A traction power substation (TPSS)
· A #10 double crossover
· Mis-labeled flood plain
· Inaccurate RPA limits
· Station is slated to be a Contractors Work Area which is tantamount to a "condemnation by designation" and located in an area that requires crossing a major roadway to construct the East Station (perhaps the I- 495 median or other clover leaf areas may work instead)
· There is no tower or elevated connection from the platform to the Cleveland site and no aerial pedestrian connection except from the platform to the Kiss and Ride on the opposite side of Rt. 123.
These are all objectionable to WEST*GROUP and can be remedied by close coordination and integration of rail plans to our proposed "with rail" long term master plan. (0113 0132-5) (0123 0158-7)

> ***Response:*** *The traction power substation and tie-breaker station would be required in this area due to the power requirements and special trackwork. In response to this and other comments, the double crossover has been relocated approximately 170 feet inbound towards the Dulles Connector Road. The RPA and floodplain limits will be updated in consultation with Fairfax County staff. The locations of areas identified as Potential Contractor Work Areas are preliminary, and their use would be based on their availability, the timing of plans for redevelopment, and the need for the site when the project progresses into final design and construction. A pedestrian bridge is currently shown connecting the south Kiss & Ride to the station mezzanine. The potential for any additional pedestrian bridge connections can be discussed with DRPT and WMATA in terms of future transit-oriented development.*

Public Comment: Why is the area of the cross over so large? How does it impact building, parking, and landscaping? What does it look like? As mentioned above, this issue should be studied very carefully as the design moves forward and appropriate features to provide mitigation of the noise should be included in the final design. (0123 0158-21)

Public Comment: Sheets 045/071 T-6 Notes. TBS-3-T-6 Alignments. The location of the proposed double cross over directly in the middle of the Cleveland Building redevelopment (potentially PRM 3.0 FAR high-rise residential mix use) creates the potential for a crossover "clack" in close proximity to high rise, high density residential development. What assurances do we have that the corridor noise technology or design has improved to avoid this potential nuisance sound. Why is the area of the cross over so large? How does it impact building, parking, and landscaping? What does it look like? (0113 0132-18)

> ***Response:*** *In response to this comment, the Project Team shifted the double crossover approximately 170 feet inbound towards the Dulles Connector Road interchange. Its location is now near the ramp terminal of the interchange and the east property line of the Cleveland Building parcel. The parapet walls that are part of the standard WMATA aerial guideway would provide significant sound attenuation for trains passing through the switches at the proposed double crossover. The size of the double crossover is the standard size shown for 14' (narrow) track centers, which is significantly less than the size of a double crossover for 40.5' (wide) track centers that were previously examined. Tie-breaker Station #3 is shown below at ground level to support the operations of the double crossover. A typical tie-breaker station is approximately 45 feet by 20 feet and about 13 feet high. They break the rail line into sections, allowing power in one or more sections to be shut down for maintenance without affecting the power supply to the rest of the system. Tie-breaker stations would be combined with traction power substations*

wherever possible. The exact locations of tie-breaker stations will be further refined during preliminary engineering.

Should Not Expand to 16 Bus Bays at Wiehle Avenue Stations

Public Comment: The SDEIS is wrong to expand Wiehle Avenue Reston bus bays to 16. This is a temporary terminal. Nine bus bays will serve adequately. Of the 7,200 weekday passengers expected, 2,645 can be expected to use the parking spaces. Another 1,050 can be expected to be dropped off (kiss-and-ride). Perhaps 950 will walk or use bicycles. That leaves 2,555 will be using buses, with 630 in the maximum hour. One bus bay is needed for express buses from Herndon every six minutes to meet each train. One is needed for North Reston Routes 552 and 554. Another is needed for South Reston Routes 551, 553 and 557, one every six minutes. Route 585 will need one. Route 980 should be extended east from Reston Town Center over Sunset Hills Road and will need half a bus bay. RIBS will need one. Three spares seem prudent, perhaps excessive. People need fewer bus bays with shorter walks to their bus and fewer places to hunt for it. (0054 0090-1)

Public Comment We also question the need for 16 bus bays for the interim terminal station at Wiehle Avenue. As Ed Tennyson has pointed out, it appears that nine bays would adequately serve the feeder bus need. (0060 0169-8)

Response: *The calculations for required bus bays at Wiehle Avenue Station are based on the number of physical bus arrivals during the peak hour, including bus platoons wherein two buses on the same route arrive simultaneously (two buses running on the same route together in a platoon is done to provide enough capacity to meet demand that cannot be met with one bus). In addition, because these routes would be arriving very frequently (every six minutes, in order to meet trains running every six minutes), it would not be physically possible to share these bays with other services. In addition to the four premium bus routes, twelve other routes would use the Wiehle facility. Because these buses would arrive less frequently (typically every 20 to 30 minutes), there is an opportunity for bay sharing among the 12 routes. Based on the re-analysis of bus arrivals during the preparation of the Final EIS and final General Plans, it was determined that 12 revenue bays and three layover bays are required at the north side station facilities and that five revenue bays are required at the southside, to be located on the eastbound exit ramp of the Dulles Toll Road.*

Station Mezzanine Impacts to Adjacent Property

Public Comment: The mezzanine design, as proposed, would impact the Aston Martin dealer and the preowned car dealerships operated by HBL at 8601 Westwood Center Drive, which are on the southwest corner of the subject intersection. We believe that these activities will be in place here for the next 10 to 20 years and so, therefore, the mezzanine is located in not the most optimally location. (0053 0139-4)

Public Comment: 5. Mezzanine design has significant impact to the Austin Martin and Pre-Owned car dealerships operated by HBL at 8601 Westwood Center Drive in the SW corner of Route 7/Tyco Road signal, and the mezzanine is optimally located for the existing and anticipated land uses expected in the next 10-20 years. (0053 0054-3)

Response: *The May 18, 2004, post-hearing conference on the Tysons West Station entrance and facilities has resulted in revisions to the Locally Preferred Alternative. The Project Team recommended and the decision-makers approved Option E, which has its station entrance at the inbound, east end of the station near Spring Hill Road.*

The entrance pavilion at the south side of the station is in the front part of the property currently leased by Rosenthal Honda. The station will have its stair towers for emergency exits on property currently leased by HBL Mercedes-Benz and by HBL Pre-Owned Cars. The station support columns will be on all three properties. The entrance pavilion, emergency exit stair towers, and

support columns will displace a limited number of parking spaces and result in alteration of on-site circulation and access for all three businesses.

Alternative Site Plans for Tysons West Station Area

Public Comment: As shown in Exhibit 2, an alternative bus facility in the northeast quadrant of Route 7 and Spring Hill Road intersection would better center bus circulation and reduce impacts on existing C-7 properties in Fairfax County. With a relocation of the mezzanine, the pedestrian access is significantly improved and ingress would be at Spring Hill Road and egress would be at Tyco Road, allows more orderly bus and car transfer points. (0053 0139-7)

Public Comment: A variation of this alternative as shown in Exhibit 3 would orient the Kiss & Ride facilities to the existing Flex industrial buildings along Tyco Road. This alternative keeps walking distances from the bus facilities at less than 1,000 feet and still maintain the car storage areas that are leased behind the Cherner parking lot. (0053 0139-8)

Public Comment: Another alternative is shown in Exhibit 4, and I'll hand out the use of the county property behind existing Tysons Fire Station may provide improved separation of access for bus facilities away from the Route 7 intersections. We believe that this alternative concerned, and it only impact I-4 and I-5 zoning. We have also included in an alternative to look at alternatives along Tyco Road that we believe maintain the integrity of the Fairfax County overlay district. (0053 0139-9)

Public Comment: Additionally, as shown in Exhibit 4, the use of County property behind the Tysons Fire Station on Spring Hill Road could allow the bus entrance to be sifted away from Route 7 while, maintaining shorter transfer distances between the bus spaces and the station entrance. Additional properties would need to be coordinated for parking impacts, and buffers, but the affected properties are zoned I-4 or I-5 and are located away from the Route 7 frontage. (0053 0054-8)

Public Comment: As shown in Exhibit 2, an alternative bus facility northeast of the Route 7/ Spring Hill Road intersection would better center the bus circulation while reducing impacts on existing C-7 commercial zoning. With the relocation of the mezzanine, pedestrian access is significantly improved and ingress via Spring Hill and egress via Tyco Road allows more orderly bus and car transfer points. The sites are currently developed with flex uses and vehicle storage. (0053 0054-6)

Public Comment: A variation on the alternative would be to maintain a bus pull-outs between Spring Hill Road and Tyco Road, but orient kiss and ride facilities to the existing flex buildings along Tyco Road. As shown in Exhibit 3, this alternative keeps walking distances from the bus bays to the platform at less than 1,000 feet and still maintains the storage area used behind the existing Cherner lot. (0053 0054-7)

Response: *The May 18, 2004, post-hearing conference on the Tysons West Station entrance and facilities resulted in revisions to the Locally Preferred Alternative. The Project Team recommended and decision-makers approved Option E, which has its station entrance at the inbound, east end of the station near Spring Hill Road.*

The bus bays and Kiss & Ride facilities are located between Tyco Road and Spring Hill Road, set back from Route 7. Since the conference, the Project Team convened to reconsider the program requirements for bus bays and reduced the number of bus bays. Unlike other options, the Kiss & Ride fully utilizes the undeveloped County land to the rear of Fire and Rescue Station No. 29.

Initial access to Option E facilities from Tyco Road would be for station access only. This roadway and the station facilities would be operated and maintained by WMATA. In response to expressions of interest in having a second access point to the station facilities and in an initiation of a street grid in this area of Tysons Corner, Option E includes a possible, later connection to Spring Hill Road. That connection cannot be advanced at this time due to its proximity to the driveways of Fire Station No. 29.

Fairfax County has formally proposed an Option F in lieu of Option E. This option would relocate Fire Station No. 29 to a more central location within Tysons Corner. DRPT will monitor the County's further development of Option F during preliminary engineering and decide whether the schedule for the project's implementation can accommodate this option.

Improved Bus Stop, Kiss & Ride, Pedestrian Walkways and Pedestrian Access at Herndon Parkway

Public Comment: The walkway to Herndon Parkway shown in the General Plans provides basic access. However, are bus stop slips envisioned on Herndon Parkway near the end of the pedestrian walkway? Where do bicyclists store their bicycles? Where do the kiss & ride vehicles wait? How do transit users from nearby office building to the east and west reach the northside touchdown? How do transit users from the office building north of the Herndon Parkway safely cross the four-lane divided roadway? Minimal improvements such as a signalized crosswalk on Herndon Parkway and multiple pedestrian sidewalks would at least fulfill the intent of the project as described on page 6-16, Section 6.2 of the Supplemental Draft EIS. (0132 0171-04)

Response: *Bicycle racks and lockers would be provided adjacent to the station entry. The issue of pedestrian access beyond what has been shown on the plans, including the possibility of a new crosswalk, will be considered during the preliminary engineering phase of the project in coordination with Fairfax County, Town of Herndon, and existing property owners. However, no additional bus stops or Kiss & Ride facilities would be provided on the north side of the DIAAH as part of the project.*

J PUBLIC AND AGENCY COMMENTS AND RESPONSES

This appendix documents the extensive collection of comments from public agencies, elected officials, business, civic association representatives, interest groups, and the general public received during and after the formal public comment periods that followed publication of the Dulles Corridor Rapid Transit Project's *Draft Environmental Impact Statement (Draft EIS) and Section 4(f) Evaluation* in June 2002 and *Supplemental Draft Environmental Impact Statement (Supplemental Draft EIS) and Section 4(f) Evaluation* in October 2003. Comments and responses are organized by chapter in accordance with the structure of the Final EIS. The outline of this Appendix J is therefore as follows:

Executive Summary

Chapter 1 Purpose and Need

Chapter 2 Alternatives Considered

Chapter 3 Social Effects

Chapter 4 Environmental Effects

Chapter 5 Economic Effects

Chapter 6 Transportation Effects

Chapter 7 Section 4(f) Evaluation

Chapter 8 Financial Analysis

Chapter 9 Secondary and Cumulative Effects

Chapter 10 Evaluation of Alternatives Carried Forward

Chapter 11 Comments, Consultations, and Coordination

Chapter 12 Draft EIS/Supplemental Draft EIS Process

Chapter 13 Project Implementation

General Plans

Indices Last Name, Identification Number and Organization

Comments are placed within the chapter to which they pertain. Within each chapter, the Draft EIS comments are placed first, and are followed by the Supplemental Draft EIS comments. Within the sets of Draft EIS and the Supplemental Draft EIS comments, the comments from government agencies are placed first in the order of Federal, State, Regional and Local. In the case of elected officials, comments are included in the appropriate level of government agency (e.g., Virginia elected officials are included with the other State Agency comments). These agency comments are followed by comments from the general public, organizations, and stakeholder groups. Similar comments are grouped together and answered by a single response.

The comments are identified by a numbering system that includes the commenter, the means of communicating the comment, and the sequence in which the comment was received. The means of communicating the comment may be through letter, public hearing testimony, comment card, e-mail, written statements, miscellaneous or a combination thereof.

The individual comments were entered into a comment database and tracked by both a unique number given to each commenter and by subject matter. The numbering system is as follows:

1. First, the commenter is identified with a unique commenter identification number, which was used for all comments that were received from that commenter.

2. Second, added to the commenter number is a unique number that was given to each piece of communication, or statement, received from the commenter (these were consecutive numbers assigned as statements were received).

3. Third, a letter follows these two numbers, indicating what type of statement was received. Designations are: letter (L), testimony (T), comment card (CC), a statement from an agency (A), email (E), or miscellaneous (M)).

4. Then, a number indicates the individual comment that came from the commenter's statement.

For example, a comment that is labeled 0204, 0247-T-4, indicates that the comment came from commenter number 0204, the comment was the 247th statement received, the statement was in the form of a testimony at one of the public hearings, and the comment is the fourth comment entered from that testimony. In this example, the commenter 0204 has submitted more than one statement for the record. Not shown in the numbering system of this Appendix J is the database code of the subject matter according to topic or sections of the Draft EIS or Supplemental Draft EIS.

Comments may be tracked by referring to the accompanying index tables for the Draft EIS and the Supplemental Draft EIS. These tables identify the commenter by name, organization (if any), government agency or jurisdiction, interest group, company, or general public; the commenter's identifier number; and the specific location and subject area of the individual comments.

The responses to the comments in this Appendix have been updated to reflect the selection and revision of the Locally Preferred Alternative; the consequential elimination of other alternatives; the results of re-analyses in support of the Final EIS; progress in the capital funding plan; and the start of the project's next phase, preliminary engineering. Thus, for many comments, the responses differ from those in the Public Hearings Reports of October 2002 and February 2004.

Within the responses, the terms *decision-makers* and *Project Team* refer to the following:

Decision-makers – The Virginia Commonwealth Transportation Board and the Board of Directors of the Washington Metropolitan Area Transit Authority, which, in similar actions, selected and revised the Locally Preferred Alternative.

Project Team – The staffs of the Virginia Department of Rail and Public Transportation and of the Washington Metropolitan Area Transit Authority, which together made recommendations to the decision-makers, the Commonwealth Transportation Board and WMATA Board of Directors.

APPENDIX J ADDENDUM

This addendum to Appendix J in Volume III of the Final EIS contains comments that the Project Team had previously published in Public Hearing Reports and Report Supplements but did not appear in Appendix J.

A. Draft EIS Comments

Chapter 2 – Alternatives Considered

BRT Under Study in Other Corridors

Public Comment: I want to conclude by saying I just received this bulletin. It came from "Don't Miss the Bus." It came from Metro. On selected high-rise routes, a new type of service called rapid bus is proposed and it could be comparable to rail transit. (0147, 0147-T –10)

> ***Response****: As part of its Regional Bus Study and in alternatives analysis of other corridors in the region, WMATA and other transit agencies have considered bus rapid transit as a mode. Also, the Project Team has acknowledged that BRT systems could carry the same level of demand as rail systems. However, within the Dulles Corridor, BRT could not satisfy the long-term travel demand of the corridor. Therefore, the Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Miscellaneous Draft EIS Comments

Public Comment: General -- The information presented in a DEIS should be presented in a manner that facilitates review by the public and government officials who might not be all that familiar with transit facility plans and analyses. The presentation of the alignment plans is sadly deficient in information that might be valuable to the reviewer of this document. Information on curve radii (which affects acoustical impacts) and design speeds (which affects operations) should be shown on each of the drawings. To have to go back to pages near the back of the set of the drawings is cumbersome and seems to be designed to discourage a thorough review. One possible accommodation which is incorporated in contract drawings is to use the Reference Drawing Box at the bottom of each sheet to indicate the sheet numbers of the pages where all of the alignment data as well structural, systems, traction power facilities may be found. (0387, 0387-L –20)

> ***Response:*** *The layout of the General Plans for presenting alignment data was developed to minimize the amount of re-work required during the development and evolution of multiple alignment alternatives. Detailed alignment data (including curve radii and design speeds) will be added to the plans developed during preliminary engineering phase.*

Chapter 4 – Environmental Effects

Local Comment: The first concern is about the impact of 26 additional rail cars at the WMATA Service and Inspection Yard at the West Falls Church Metrorail Station on homes in the Lemon Road community. Rail cars entering and leaving the yard at late night and early morning hours are a source of increased noise, loud horns and squealing brakes. The Project Team has identified this impact, but has not specifically proposed any mitigation strategies. (0479, 0479-L –10)

> ***Response:*** *With respect to the concerns of communities on the noise of the Metrorail West Falls Church Yard, the Project Team recommended and the decision-makers approved the enclosure of 1) a portion of the existing loop track at the yard's eastern end and 2) the new yard lead in box structures. These noise mitigation measures by the Project will reduce the wheel squeal noise of the train movements within the Yard. The Project Team notes, however, that new residences*

have been recently constructed and occupied adjacent to the West Falls Church S&I Yard without any noise mitigation provided by the residential developer. As during the past ten-year effort to address yard noise, there will be coordination among DRPT, WMATA, Fairfax County officials and staff, and representatives of the communities during preliminary engineering and final design.

The number of additional cars at West Falls Church Yard has increased from 26 in the Draft EIS to 42 in the Supplemental Draft EIS and Final EIS in order to support the Metrorail fleet of the Wiehle Avenue Extension. Wheel squeal from the new yard lead (for Metrorail trains to and from the Dulles Corridor Line) at the east end of the yard was included in the modeling analysis. Based on measured noise levels from the current wheel squeal along a similar radius curve at the yard, exceedances of the FTA impact criteria are predicted at nearby residences. No exceedances are predicted from the Project's aerial guideway in the median of the Dulles Connector Road.

Other sources, such as horns, were not included in the modeling analysis. Brake squeal was not determined to be a major problem. Based on the current operating schedule at the yard, the increase in the overall yard noise due to the cleaning and general operation of 42 additional Metrorail cars needed for the Project is expected to be minimal.

Chapter 6 – Transportation Effects

Local Comment: What about just-in-time riding sharing (works great in Fall Church where I used to live and Dale City for the ability to use HOV lanes - have you planned for that process to happen at the rail stations…are you promoting that to ease congestion??? (0233, 0426-M –21)

Response: *The issues associated with implementing just-in-time ridesharing zones in the Dulles Corridor and the possible benefits of increased HOV were explored as part of the Project Team's review of Dulles Plan B. Neither the Project Team nor VDOT could develop facilities with the express purpose of encouraging just-in-time ridesharing (also known as "slugging" or casual carpooling) because of the tremendous liability risk associated with such activities. While these agencies recognize the benefits that have been gained in the I-95/I-395 corridor through this informal ridesharing arrangement, the random pairing of drivers and passengers inherent in this form of commuting presents risks that most public agencies are not prepared to assume.*

Public Comment: The DEIS has listed a specific set of goals for all of the alternatives. By moving the planned parking garage to the Route 772 station, and by doing so create a true terminus station, the following stated goals could be achieved:
1. Goal 1: Improve Transportation Service - Travel time within the corridor and region could be improved. The forecasted LOS at the critical intersection of Route 789 and Route 606 and the Dulles Greenway links clearly illustrate this fact.
2. Goal 2: Increase Transit Ridership - The Route 772 station would capture the traffic from the populations of the massive Moorefield Station project in addition to the aforementioned Ashburn Village, Ashburn Farms, Belmont, Broadlands and Brambleton communities.
3. Goal 3 - Support Future Development - Common planning guidelines define that transit type stations should be integrated into mixed use developments such as the Moorefield Station plan. The current Director of Planning for Loudoun County, Julie Pastor, stated at the July 11th Seminar and Reception at the Center for Innovative Technology that the Route 606 station would be "challenged" because there are no residential opportunities within the Route 606 station area. Future developments would be choked at the development surrounding the Route 606 station with the planned LOS's of F. This would suffocate developments surrounding the Dulles Airport including the AOL Time Warner and MCI WorldCom campuses.
4. Goal 4: Support Environmental Quality - Should the Route 606 station be developed with the 4,000 car parking garage, the overall majority of cars will pass the Route 772 station resulting in increased commuting times, increased commuting costs and increased pollution. (0003, 0003-L –4)

Response: *As evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team in cooperation with Loudoun County reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces. Loudoun County arranged with two owner/developers for the location of the two park-and-ride structures at Route 772 Station.*

The current station facility plans for the Route 772 Station are designed to integrate the station access points with proposed transit-oriented developments. They also include Kiss & Ride facilities and feeder bus facilities, and would capture a portion of travelers from the station service area and from the transit-oriented developments. Loudoun County recognizes that the Route 772 Station will function as a major intermodal facility for transit bus, shuttle bus, and Metrorail. In fact, WMATA terms the bus-to-rail interface as the heart of the Metrorail system.

As indicated in the General Plans (Final EIS Volume V), construction of the proposed Dulles Greenway overpass is assumed to be carried out by others. Although the Route 772 Station of the revised LPA includes station facilities on both sides of the Dulles Greenway, the Project has determined that transit-related use of this overpass would be limited. Other roadways shown are included in the phased implementation of adjacent developments as approved by Loudoun County. Station access will be the subject of continuing coordination with Loudoun County, property owners, and developers in station area.

The Project Team notes that the morning peak hour for access to the Route 606 Station with its 2,750 park-and-ride spaces will precede any peak traffic for access to adjoining and nearby developments. Based on the evidence of Metrorail system, the park-and-ride facility of Route 606 Station will be full by 7:30 a.m. and more likely earlier. Moreover, the two-hour peak periods of station ingress and egress will have an even distribution of vehicles without a defined surge, at times called the peak of the peak. Therefore, there should be no concerns of traffic congestion due to the Route 606 Station.

Public Comment: The number of Blue Line trains going to D.C. from Rosslyn needs to be decreased to allow better headway on the Orange Line. (0043, 0276-T –5)

Response: *Re-routing of one-half of the Blue Line trains along the Yellow Line rather than through Rosslyn has been identified in the WMATA Core Capacity Study and Capital Improvement Plan as a possible means of increasing Orange Line service reliability but not frequency. This Blue Line reconfiguration was incorporated into the Metrorail operating plans used to prepare the Final EIS.*

Chapter 8 – Financial Analysis

Public Comment: Financing part of the costs with excess toll revenue is not news. The proposal to start raising the tolls in January 2003 is unwise. If tolls must be raised, they should not be raised until at least ground has been broken to begin the project. In no case should the impression be left that they will go up soon go unchallenged. (0208, 0208-M –6)

Response: *As described in Chapter 8 of the Final EIS, the Commonwealth of Virginia will be responsible for 25 percent of the Project's capital costs. For the Wiehle Avenue Extension, the Commonwealth will use revenues from the Virginia Transportation Act of 2000 and Dulles Toll Road revenues. A planned toll increase would raise tolls at the main toll plaza to $0.75 and at each ramp toll plaza to $0.50. For the Full LPA, in addition to the two sources of the Wiehle Avenue Extension, the Commonwealth may consider other sources, including future transportation appropriations.*

Public Comment: I spoke with Joan DuBois this afternoon and she suggested that I send an email to you to request some more information on the impacts of the Rail and BRT alternatives on several parcels

located near the proposed Tysons West Station. Several of my firm's clients are currently property holders in the Tysons West area and are looking for more information. In particular, I am looking for information on whether or not the following parcels will be condemned:
029-1-001-0018
029-1-001-0022A
029-1-001-0011
In speaking with Joan, she said that parcel 18 was not scheduled for relocation. Am I correct to assume that this means that there will not be a taking on this site should any of the alternatives be chosen? She also said that parcel 22A was listed as having a permanent surface easement, but was not scheduled for business relocation. What does that mean? I also understand that there is the possibility that parcel 11 may be taken depending on the alternative chosen. Which alternatives would result in this? (0296, 0296-E –1)

> ***Response:*** *Parcel 029-1-01-0018 had never been affected by any of the Build Alternatives evaluated in the Draft EIS.*
>
> *Parcel 029-1-01-0011 had been affected by the BRT/Metrorail Build Alternative of the Draft EIS. However, the Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT/Metrorail Alternative was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *Parcel 029-1-01-0022A had been affected by property requirements of the Tysons West Station facilities as part of the Metrorail Build Alternative of the Draft EIS. However, a May 2004 post-hearing conference addressed options to the Tysons West Station entrance and facilities. The selected option, located between Tyco Road and Spring Hill Road, does not affect Parcel 029-1-01-0022A.*

Public Comment: Also, has a timeline for condemnation been established? One of the property owners heard that the condemnation hearings were scheduled to occur before the end of the year. As you can imagine, the property owners that are scheduled for a future taking are interested to learn when this might occur and are concerned about the potential backlash from being listed as a property that will be taken. It can be hard to rent space in a warehouse that is set to be taken in x number of years. (0296, 0296-E –2)

> ***Response:*** *Right-of-way acquisition associated with the Wiehle Avenue Extension is anticipated to begin in early 2006.*

B. Supplemental Draft EIS Comments

Suggestions for Alternatives

Chapter 2 – Alternatives Considered

Public Comment: The subsidy requirements of Dulles Rail are so high that it appears that a bus rapid-transit system running over congestion-free high-occupancy toll lanes will provide superior transit options at a fraction of the cost including a mix of local and express service which is not part of the rail proposal. Accordingly, BRT and HOT needs to be explored as an alternative. (0061 0069-9)

Public Comment: The subsidy requirements of Dulles Rail are so high that it appears that a Bus Rapid Transit System running over congestion free Managed Lanes (High Occupancy Toll or High Occupancy Vehicle) will provide superior transit options at a fraction of the cost, including a mix of local and express service. (0061 0117-11)

Public Comment: BRT on HOT/HOV needs to be explored as an alternative in the Environmental Impact Statements prepared for FTA review. Please calculate the fraction of the capacity of a managed lane (busway, HOT, or HOV) that would be required for the forecasted transit mode. Compare and contrast

your calculations with that of existing managed lanes such as Shirley Highway along I-395 and the El Monte Busway (I-10) in Los Angeles. (0061 0117-12)

Public Comment: Bus rapid transit on H-15 (ph) needs to be explored as an alternative. (0061 0136-10)

Public Comment: --[H]eavy rail currently costs $3 1/2 million per mile per year in annual subsidies. HOT lanes running Bus Rapid Transit should produce a surplus. The two concepts are incompatible, however, due to limitations on the right of way-- an either/or choice. Why is the former being proposed and the latter ignored? (0061 0168-2)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Miscellaneous Supplemental Draft EIS Comments

Chapter 4 – Environmental Effects

Public Comment: While your report on Section 4.7.3 speaks of temporary noise barriers being erected during construction, I would urge that a coordinated agency mitigation effort result in a significant barrier before construction to mitigation not only construction noise, operating noise, but the visual impact all at once. (0036 0062-4)

> ***Response:*** *Construction-related noise effects are described in Section 4.7.6 of the Final EIS. Related mitigation is described in Section 4.7.7 of the Final EIS. DRPT, the project sponsor, will prepare and implement a mitigation monitoring plan, based on the mitigation commitments in the FTA Record of Decision.*

Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

REF: Proposed Dulles Corridor Rapid Transit Project
Fairfax and Loudoun Counties, Virginia

Dear Mr. Rohrer:

The ACHP received your notification and supporting documentation regarding the adverse effects of the referenced project on properties listed on and eligible for listing on the National Register of Historic Places. Based upon the information you provided, we do not believe that our participation in consultation to resolve adverse effects is needed. However, should circumstances change and you determine that our participation is required, please notify us. Pursuant to 36 CFR 800.6(b)(iv), you will need to file the final Programmatic Agreement (PA) and related documentation at the conclusion of the consultation process. The filing of the PA with us is required in order to complete the requirements of Section 106 of the National Historic Preservation Act.

Thank you for providing us with your notification of adverse effect. If you have any questions or require further assistance, please contact Martha Catlin at 202-606-8505.

Sincerely,

Don L. Klima
Director
Office of Federal Agency Programs

ADVISORY COUNCIL ON HISTORIC PRESERVATION

Advisory Council On Historic Preservation

The Old Post Office Building
1100 Pennsylvania Avenue, NW, #809
Washington, DC 20004

JUL 20 2000

Mr. Len Alfredson
WMATA Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Ref: Dulles Corridor Rapid Transit Project
Fairfax and Loudoun Counties, Virginia

Dear Mr. Alfredson:

Recently the Council received your invitation to a pre-scoping session for the referenced project. While we appreciate your notification and request for our participation in this process, it is not the Council's role, nor do we have the resources to participate at this stage. However, we do wish to call your attention to the requirements of Section 106 of the National Historic Preservation Act and the Council's implementing regulations (36 CFR Part 800). The Council's regulations set forth the steps to be taken in order to identify historic properties and assess effects associated with a proposed Federal undertaking. We strongly recommend that any environmental document be coordinated with the information necessary to initiate and complete the 106 process. If it is determined, in consultation with the Virginia State Historic Preservation Officer and other consulting parties, that the project may adversely affect historic properties, the Council should be notified by the Federal Transit Administration (FTA) and given the opportunity to participate in further consultation to consider means to avoid or minimize those impacts.

FTA and WMATA should initiate coordination with the Virginia State Historic Preservation Officer as soon as possible and work closely with them to take advantage of their knowledge of cultural resources in the area. Any further request for the Council's involvement regarding this project should be initiated by the sponsoring Federal agency, and accompanied by the requisite supporting documentation specified at 36 CFR § 800.11. Should you have any questions regarding the Section 106 process, you may contact MaryAnn Naber at (202) 606-8534 or by email at mnaber @achp.gov.

Sincerely,

Priscilla J. Mull

Don L. Klima

June 27, 2000

Mr. Len Alfredson
WMATA Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Reference: Dulles Airport-Loudoun County Virginia

Dear Mr. Robb:

This letter is in response to the invitation to attend the pre-scoping session scheduled for July 11, 2000. Our office is unable to send a representative, however we would like to submit our comments at this time. To better respond, let me briefly provide some background information on the National Flood Insurance Program (NFIP). In 1968, the U.S. Congress passed the National Flood Insurance Act, which created the NFIP. The NFIP was later broadened and modified with the passage of the Flood Disaster Protection Act of 1973 and other legislative measures. The NFIP is designed to reduce future flood losses through local floodplain management and to provide protection for property owners against potential losses through flood insurance. As part of the agreement for making flood insurance available in a community, the NFIP requires the participating community to adopt floodplain management ordinances containing certain minimum requirements intended to reduce future flood losses.

Any project involving the development, encroachment, or modification of the 100-year floodplain, including channel relocation, must meet the requirements as stipulated by the community's floodplain management ordinance.

In support of the NFIP, FEMA has undertaken a massive effort of flood hazard identification and mapping to produce Flood Hazard Boundary Maps (FHBM), Flood Insurance Rate Maps (FIRM), and Flood Boundary and Floodway Maps (FBFM). Since the proposed project will impact or relocate existing streams, you must apply for a Conditional Letter of Map Revision (CLOMR) prior to construction.

I have enclosed for your use all the necessary application forms required for a CLOMR. As explained in the packet, "Revisions to National Flood Insurance Program Maps", FEMA will issue a Conditional Letter of Map Revision for proposed projects in the 100-year floodplain provided all

the necessary plans and hydraulic data are submitted. FEMA will then follow up with a physical map revision when as-built plans are submitted. The only way we can keep each community's floodplain maps up-to-date is by obtaining your cooperation in this effort.

In addition, Executive Order (E.O.) 11988 requires that Federal agencies avoid the direct and indirect support of floodplain development whenever there is a practicable alternative. The preferred method for satisfying this requirement is to avoid sites in the 100-year floodplain and, for those actions deemed critical, sites in the 500-year floodplain. If an action must be located in the floodplain, then the agency must avoid the long-and short-term adverse impacts associated with the occupancy and modifications of the floodplain and must minimize the potential harm to people and property and to natural and beneficial floodplain values. For example, flood easements, deed restrictions, elevation of residential structures, or buy-outs may be necessary to mitigate property owners adversely impacted by this project.

I have enclosed a copy of a booklet entitled "Floodplain Management Guidelines for Implementing E.O. 11988". Within this booklet, *Part II - Decision Making Process*, outlines an eight step process designed to reflect the decision making process required under Section 2(a)(1) of the Order. Section 2 states,

> *"In carrying out the activities described in Section 1 of this Order, each agency has a responsibility to evaluate the potential effects of any actions it may take in a floodplain; to ensure that its planning programs and budget requests reflect consideration of flood hazards and floodplain management; and to prescribe procedures to implement the policies and requirements of this Order."*

In summary, the Federal Agency funding or constructing a project is responsible to ensure compliance with E.O. 11988. If the floodplain cannot be avoided, then the minimum requirements of the National Flood Insurance Program must be met.

If you have any questions concerning this letter, the map revision process, E.O. 11988 or any other floodplain management issue, please feel free to contact me (215) 931-5665 or our technical hotline at (877) FEMA MAP (toll free). Additional information may be obtained by logging onto www.fema.gov/mit/tsd.

Sincerely,

Erik J. Rourke

Erik J. Rourke
Regional Hydrologist

Enclosure: 1. Revisions to National Flood Insurance Program Maps
2. Floodplain Management Guidelines for Implementing E.O. 11988

K.1.3 United States Army Corps of Engineers

- March 22, 2002

U.S. Army Corps of Engineers
Norfolk District,

March 22, 2002

Project Number: 02-N0033

Waterway: Various waterways

1. Participant:
Dulles Corridor
Attn: John Dittmeier
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

2. Authorized Agent:
Coastal Resources, Inc.
Attn: Bridgette Girllo
2988 Solomns Island Raod
Edgewater, Maryland 21037

3. Address of Job Site:
The Dulles Corridor Rapid Transit Project study area begins at the I-66/Dulles Connector Road interchange in Fairfax County and extends north along the Dulles Airport Access/Toll Road to its terminus at the Route 772 interchange with the Greenway in Loudoun County, Virginia.

4. Project Description:
The project consists of a jurisdictional determination for the proposed Dulles Corridor Rapid Transit Project.

5. Findings

A site inspection has verified that waters and/or wetlands regulated under Section 404 of the Clean Water Act (33 U.S.C. 1344) exist at the location stated above. The wetland delineation and site plan submitted by letter dated June 26, 2001 and revisions contained in your field review memo dated February 27, 2002 by Coastal Resources, Inc., in accordance with the methodology described in the 1987 Corps of Engineers Wetland Delineation Manual. This confirmation is valid for a period of five years from the date of this letter unless new information warrants revision before the expiration date.

Prior to commencing work you must obtain the proper authorization to perform work in wetlands and/or waters of the U.S. Please note that performing the proposed work without proper authorization would be in violation of the Clean Water Act.

Dear Mr. Hill:

RE: Dulles Corridor Rapid Transit Project Draft EIS

NRCS has reviewed this document to ensure that impacts to soils and prime farmland were adequately documented. Section 4.1.3.3 – Soils and Section 4.1.3.4 – Prime Farmland provide this documentation.

Virginia NRCS has no objection to this proposal.

Sincerely,

M. Denise Doetzer

NATIONAL PARK SERVICE
Wolf Trap Farm Park for the Performing Arts
1551 Trap Road
Vienna, Virginia 22182

IN REPLY REFER TO:
W46 (NCR-WOTR)

AUG 9 2000

Mr. Len Alfredson, WMATA Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Alfredson:

I appreciate this opportunity to comment on the Dulles Corridor Rapid Transit Project. I attended the public scoping meeting held on July 26, and I have reviewed the Scoping Information Packet.

Wolf Trap Farm Park for the Performing Arts is the only national park dedicated solely to the performing arts. The park's primary performance venue, the Filene Center, is an amphitheater that normally operates from mid-May through mid- September. Because the park, our patrons, and our community may be affected by any of the project's three "build" alternatives, we have a keen interest in the project.

The project's third build alternative includes a "to be determined" metro station at Wolf Trap Farm Park for the Performing Arts. Our partner, the Wolf Trap Foundation for the Performing Arts, currently contracts for Metro Bus service to and from the West Falls Church Metro Station for Filene Center patrons. There is no other mode of public mass transportation to the park. Therefore, a station that allows access to park facilities and programs, would be a great convenience to our patrons.

However, a full-time, full-service station next to Wolf Trap Farm Park would be troubling. Not only is land availability an issue, we would have concerns about noise, traffic, and other potential conflicts with the park.

We are particularly concerned about any potential noise impacts. Public Law 97-310, establishes acceptable Dulles Road corridor noise levels to protect the Filene Center from undue noise pollution. We are hopeful that potential noise impacts and appropriate mitigation will receive consideration in all alternatives.

A final concern is the Trap Road Bridge that traverses over the Dulles Highway and the Toll Road. This bridge greatly affects traffic circulation in the park and in the neighboring community. Should any of the build alternatives require replacement of this bridge, we would like to be involved in the redesign.

I appreciate your efforts to include us in this project study. If you have any questions or if I can be of any assistance, please do not hesitate to call me at (703) 255-1808.

Sincerely,

William J. Crockett
Director

Mr. Karl A. Rohrer, AICP
Project Manager, VDPRT
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

SA 9105

Dear Mr. Rohrer:

We have reviewed the Supplemental Draft Environmental Impacts Statement (EIS) for the Dulles Corridor Rapid Transit Project. The Federal Aviation Administration (FAA) is supportive of the efforts and we have the following comments related to the document.

Concerning FAA's issuance of a Decision for the Environmental Impact Statement.

We understand that Phase 1 of the project would provide rail access to a station at Whiele Avenue with Executive Bus Service providing access from that station to the airport terminal. This phase also provides for an expansion of the Dulles North Transit Center primarily to provide parking for increased ridership over the existing bus service to points east and to Washington, D.C. Phase 2 of the project would extend the rail service to the airport and construct the rail service yard. Subject to satisfactory completion of the EIS, and after the Federal Transit Administration issues their Record of Decision, we would anticipate issuing an FAA Decision on the entire ultimate project.

Concerning the release of the Dulles Access Highway right-of-way for the Rapid Transit project:

We believe that the Metropolitan Washington Airports Authority (the Authority), which operates the airport under a lease agreement from the United States of America, can provide a right-of-way on airport property, specifically along and within the median of the Dulles Airport Access Highway, provided that it provides a means for passengers to access the airport. Our office would have to review and approve the proposed Right of Way agreement before it is executed by the Authority. However, our office cannot authorize a "fee simple" release of this Right of Way or of any airport property. We can only concur with the Authority releasing their interest in the land for the remaining life of their lease. We believe that release of a "fee simple" interest in the property would require approval action at the U. S. Department of Transportation level or possibly higher.

Furthermore, we believe that the Authority can release its interest in the Right of Way at no cost to the rail operating authority, provided the rail system accesses and benefits the airport. Executive bus service from the proposed Whiele Avenue station to the airport would be considered as providing airport access for the purposes of this no-cost land interest transfer. However, if passenger service is not provided from the rail station to the airport then the Authority's interest in the land could not be conveyed at no-cost, and the rail authority would have to pay the fair market value for the land interest.

Concerning the release of airport property for a rail maintenance yard.

While we can concur with the Authority's release of its interest in airport property for the rail maintenance yard, the Authority must receive the fair market value for this land. We could consider a reduction in the fair market value proportional to the airport passengers' share of the use of the rail extension compared to the total passengers. A release of "fee interest" in the land for the rail maintenance yard would require the same approval level as for the access road right-of-way discussed above.

We hope this information is helpful with continued planning for the Dulles Corridor Transit improvements. If you have any questions on the above comments, please do not hesitate to contact us.

Sincerely,

Terry J. Page, Manager
Washington Airports District Office

~~Mr. John Dittmeier~~
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Dear Mr. Dittmeier:

As requested in the coordination meeting held October 10th this letter provides elaboration on some of the issues we have raised in our earlier comment letter and various communications we have had over the last year concerning the proposed Dulles Corridor rail project.

As we have stated earlier, under the Federal Aviation Administration (FAA) **Policy and Procedures Concerning the Use of Airport Revenue**, published in the Federal Register on February 16, 1999, the Authority would be required to obtain the fair market value in compensation for any airport property used for the project. This policy applies to the Dulles Airport Access Road and any stations or other facilities that would be located on airport land.

One of the major issues under discussion has been the siting of a rail yard on airport property. We are concerned that constructing the rail yard on Site 15 appears to have the greatest environmental impacts of the three alternatives presented in the Draft Environmental Impact Statement (DEIS). Also, the FAA believes that a rail yard located on Dulles International Airport is not a desirable use of airport land. We have concerns that the preferred alternative may not pass legal muster under the National Environmental Policy Act since there appears to be an practicable alternative rail yard site that meets the project purpose with less adverse environmental impact.

To access Site 15 on the airport property, the yard rail lead cuts a swath through approximately 2,500 linear feet of mostly forested wetlands and crosses Horsepen Run. The impacts of Site 7, previously identified as the most viable site both operationally and environmentally, has floodplain impacts but no wetland impacts. Federal regulations allow impacts to wetlands only if there are no practicable alternatives. Likewise, Executive Order 11988 has a practicability test for floodplain impacts. Our Airport Environmental Handbook, FAA Order 5050.4a, requires that coordination be done with agencies with special interest in wetlands. This Order states that agencies with permitting actions, such as the U.S. Army Corps of Engineers and state agencies, Virginia

Department of Environmental Quality (DEQ) in this case, shall be asked to advise if they foresee any difficulty issuing their permits for the project. I understand from our last meeting that the Corps has not been asked this but the DEQ may have commented. We suggest that you coordinate with these agencies and provide documentation from them in the Final Environmental Impact Statement (FEIS). The FEIS must demonstrate that Site 15 is the least damaging practicable alternative if it were to be approved. The FAA is required to write a Record of Decision (ROD) for the project that must pass legal review.

We have also expressed concerns about security for the Airport. The project, particularly the proposed rail yard, is a substantial intrusion into airport property. As we discussed, the Transportation Security Agency (TSA) now handles airport security. We would not be comfortable with the proposed project unless TSA "signs off" on the project. The Federal Transit Administration may also require "sign off" for the whole project since it is a transportation project and may be within the purview of TSA.

In order for FAA to write a favorable ROD for the project, first the Federal Transit Administration (FTA) must issue their ROD and the Metropolitan Washington Airports Authority must show the project on their Airport Layout Plan and obtain FAA approval.

At the last meeting, MWAA's policy on keeping occupied structures out of the inner approach to runways was discussed. This is an extension of FAA's policy to keep Runway Protection Zones clear of places of public assembly as well as some other uses. The building associated with the rail yard is shown outside of the approach to a proposed new runway located 4,000' west of the existing Runway 1L/19R. As discussed, this is only one of several alternatives for the location of the proposed new runway that is being studied in our EIS. If a new runway were to be constructed at some other separation distance from the existing runway, the design of the rail yard must respect the new approach or MWAA must revise their policy.

If you have any questions about these comments, please contact Mr. Joe Delia at (703) 661-1358 in regard to the land issues or Mr. Frank Smigelski at (703) 661-1365 in regard to environmental issues.

Sincerely,

Terry J. Page, Manager

Mr. John Dittmeier
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

0485

Dear Mr. Dittmeier:

Thank you for sending the Federal Aviation Administration (FAA) the 95% Draft Environmental Impact Statement (DEIS) for the Dulles Corridor Rapid Transit Project. We have several comments for you to consider.

As you know from our meeting, held October 17, 2001, a rail yard sited on Dulles International Airport is not a desirable use of airport land. Rail yard Site 15, one of three remaining alternatives, would be located on the airport. If it is determined through the EIS process that this site meets your operational needs and receives environmental approval, land will have to be acquired from the airport.

The land on which Site 15 is located is dedicated airport property. The Metropolitan Washington Airports Authority (the Authority) is required to seek FAA approval for the release of any property dedicated for airport purposes as identified on the Exhibit "A" Property Map for the airport. Also, under the **Federal Revenue Diversion Policy**, FAA will be required to publish the intent to release this property in the Federal Register for 30 days to solicit public comments. The Authority would be required to obtain the fair market value in compensation for the property.

We are also concerned with the comparison of environmental impacts for the three rail yard sites. Site 15 appears to have the greatest environmental impacts. In addition to the impacts quantified in the 95% DEIS, it appears that there would be additional impacts to resources. It appears that a swath would have to be cut through the forested wetlands and that additional fill, beyond the footprint of the pier footings, would have to be placed for construction access and perhaps track maintenance. We believe that these impacts should be quantified and presented in the DEIS.

The graphics provided should be consistent. The Draft General Plans for Facilities show environmental resources on some drawings yet they are omitted on others. For example, sheet 922, Metrorail Yard Site 7 shows wetlands, waters and floodplains in the area while

sheet numbers 925 depicting the Metrorail Yard Site 15 and sheet 926 depicting Metrorail Yard Site 20 do not show these environmental resources.

If you have any questions about these comments, please contact Mr. Joe Delia at (703) 661-1358 in regard to the land issues or Mr. Frank Smigelski at (703) 661-1365 in regard to environmental issues.

Sincerely,

Terry J. Page, Manager
Washington Airports District Office

0100 -

Dear Mr. Roher:

In accordance with the National Environmental Policy Act (NEPA), and Section 309 of the Clean Air Act , the Environmental Protection Agency Region 3 (EPA) offers the following comments regarding the Dulles Corridor Rapid Transit Project Supplemental Draft Environmental Impact Statement (SDEIS) and Section 4(f) Evaluation. This project was initially described in the context of a Draft Environmental Impact Statement (DEIS) in June 2002. EPA rated the DEIS and the locally preferred alternative with Lack of Objections with Adequate documentation (LO-1) in August 2002.

The SDEIS describes and summarizes changes of the potential transportation and environmental impacts related to minor design changes that resulted from the review of the DEIS and public comments. In addition, due to funding constraints, the overall project is now proposed to be completed in two phases with the final completion pushed to 2015 instead of 2009. These changes in the project scope and design were made after the completion of the DEIS and are the major focus of the SDEIS.

The locally preferred alternative continues to be the development of the full scope of the project with the minor design changes that resulted from the review of the DEIS and public comment. The project limits extend 24 miles from the vicinity of the existing West Falls Church Metrorail station in Fairfax County, Virginia westward to the vicinity of Rt 772 just west of Dulles Airport in Loudoun County, Virginia. The project is located in the rapidly growing and heavily congested Dulles Corridor which includes Dulles International Airport and the major employment hub of Tyson's Corner. The project would serve to link these major traffic generators with the regional mass transit system providing a direct rapid transit link between downtown Washington DC, Tyson's Corner and Dulles Airport.

Alternatives studied in the SDEIS included 1) the no-build alternative, 2) the DEIS locally preferred alternative (Metrorail extension to Dulles Airport). 3) the SDEIS modified locally preferred alternative (Metrorail extension to Dulles Airport with deign modifications) and 4) a phased approach, which includes Metrorail extension as far as Tyson's Corner and interim bus service to Dulles Airport by 2009 with completion of the Metrorail to Dulles Airport by 2015.

The suggested design changes to the locally preferred alternative, Alternative 3, mostly resulted in no change or a reduction in impacts. There are no identified major community impacts, Environmental Justice issues, or natural resource issues. The project continues to be confined to existing right-of-way or is located on existing parking lots, streets and other developed lands. There are still no residential displacements and commercial displacements appear to be less as a result of the revisions. Wetland and stream impacts are less than that associated with a typical residential development in the area. The modified Metrorail alternative remains on the Metropolitan Washington Council of Governments (MWCOG) Constrained Long Range Transportation Plan (CLRP) and it conforms with regional air quality plans.

Phasing of the project will result in total impacts similar to the SDEIS modified locally preferred alternative (Metrorail extension to Dulles Airport with deign modifications). However, phasing of the project does appear to adversely effect early year ridership numbers and thus may have less of an air quality and traffic benefit in the short run as compared to an early full build out. However, all alternatives conform to the regional air quality plans.

Consequently EPA continues to rate the Dulles Corridor Rapid Transit Project and the SDEIS with a Lack of Objections with Adequate documentation (LO-1). We encourage the development of the full Metrorail alternative because with the highest ridership, it will have the greatest capacity of moving people through the corridor, and should have the greatest impact on reducing congestion and air pollution.

If you have any questions or concerns regarding this letter please feel free to contact me at 215-814-2995 or Mr. Peter Stokely of my staff at 703-648-4292.

Sincerely,

William Hoffman, Director
Office of Environmental Programs

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION III
1650 Arch St., Philadelphia, PA 19103

16.317
AUG 22 2002
0303 A

AUG 20 2002

Mr. Corey W. Hill
Northern Virginia Regional Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard
Suite 300
Arlington, VA 22209

Dear Mr. Hill:

In accordance with the National Environmental Policy Act, and Section 309 of the Clean Air Act, the Environmental Protection Agency Region III (EPA) offers the following comments regarding the Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation.

The DEIS describes and summarizes the potential transportation and environmental impacts related to developing major new transit system enhancements in the Dulles Corridor by providing a direct connection to the existing regional Metrorail system. The project limits extend 24 miles from the vicinity of the existing West Falls Church Metrorail station in Fairfax County, Virginia westward to the vicinity of Rt 772 just west of Dulles Airport in Loudoun County, Virginia.

Alternatives studied in the DEIS included 1) the no-build alternative, 2) Bus Rapid Transit on a dedicated ROW the entire project length, 3) Metrorail extension to Tysons Corner and Bus Rapid Transit to the westward limits of the study, 4) Metrorail the entire project length and 5) a phased implementation of the full Metrorail alternative beginning with Bus Rapid Transit, followed by incremental construction of Metrorail.

This project is located in the rapidly growing and heavily congested Dulles Corridor which includes Dulles International Airport and the major employment hub of Tysons Corner. The project would serve to link these major traffic generators with the regional mass transit system providing a direct rapid transit link between downtown Washington DC, Tysons Corner and Dulles Airport.

Environmental impacts of this proposal are minor and EPA has not identified any potential environmental impacts that would require substantive changes to any of the alternatives. The project is confined to existing right-of-way or is located on existing parking lots, streets and other developed lands. There are no residential displacements and up to only six commercial displacements associated with any of the alternatives. The Metrorail alternative is on the Metropolitan Washington Council of Governments (MWCOG) Constrained Long Range Transportation Plan (CLRP) and it conforms with regional air quality plans. Wetland and stream

impacts are less than that associated with a typical residential development in the area. Noise, vibration and visual impacts were the only significant issues identified in the DEIS and the DEIS identified ways to minimize and mitigate these impacts.

Projected opening year ridership is estimated to be 27,000 to 72,000 average weekday riders depending on the alternative chosen. This project will provide a clean air alternative transportation mode for many commuters and travelers. The environmental impacts are less than the typically more environmentally damaging highway improvements. For example this project is projected to move up to 87,000 riders a day by 2025 with no residential displacements. Compare that to the recently proposed Capital Beltway improvements which displaced up to 300 residences and would adversely impact many more, while providing 2025 capacity for 2000-6000 more cars each rush hour or up to 42,000 cars per day.

Consequently EPA rates this project and the associated documentation with Lack of Objections with Adequate documentation (LO-1). Enclosed for your reference is a copy of EPA's rating system. We encourage the development of the full Metrorail alternative because with the highest ridership it will have the greatest capacity of moving people through the corridor and should have the greatest impact on reducing congestion and air pollution. The full Metrorail alternative will be a permanent alternative to the heavily congested roads in the Dulles Corridor and is supported by more businesses, residences and community groups than any other alternative. In addition, the full Metrorail alternative is on the MWCOG CLRP and has been found to conform to regional air quality plans.

If you have any questions or concerns regarding this letter please feel free to contact me at 215-814-3367 or Mr. Peter Stokely at 703-648-4292.

Sincerely,

William Arguto
NEPA/Fed Fac Team Leader

Enclosure

SUMMARY OF RATING DEFINITIONS AND FOLLOW UP ACTION*

Environmental Impact of the Action

LO--Lack of Objections
The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC--Environmental Concerns
The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

EO--Environmental Objections
The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU--Environmentally Unsatisfactory
The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

Adequacy of the Impact Statement

Category 1--Adequate
The EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2--Insufficient Information
The draft EIS does not contain sufficient information for the EPA fully assess the environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3--Inadequate
EPA does not believe that draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640 Policy and Procedures for the Review of the Federal Actions Impacting the Environment.

Mr. Karl A. Rohrer
Project Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Dear Mr. Rohrer:

On behalf of the Metropolitan Washington Airports Authority (Airports Authority) I am pleased to reiterate our support for the Dulles Corridor Rapid Transit Project, and to comment on the October 2003 Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation. The Airports Authority has a very substantial interest in providing the best access to Washington Dulles International Airport (IAD) for the Washington metropolitan region, and supports the extension of Metrorail to IAD as vital to such access. For this reason, the Airports Authority Board of Directors on November 6, 2002 endorsed the Metrorail alternative, providing heavy rail service through the entire corridor, as essential to the region's and its own interests, and the Board urged the Commonwealth Transportation Board to adopt Metrorail as the Locally Preferred Alternative.

The Airports Authority is disappointed that the Federal Transit Administration is considering only a first phase of construction, from West Falls Church to Wiehle Avenue, for inclusion in the FY 2004-2009 New Starts Program, and is making no commitment to funding the completion of the project to IAD and beyond. Nevertheless, we are pleased that the proposed Phase I does not stop at Tysons Corner, but carries the project back to the median of the Dulles International Airport Access Highway (DIAAH).

The Authority's continued support of the project is subject to three conditions:

1. The FTA reauthorization process needs to recognize the ultimate goal to complete the rail line out to and beyond IAD.
2. Advanced additional engineering, must proceed beyond the initial segment and include the entire project.
3. There needs to be a Memorandum of Understanding among the local partners that captures a joint commitment to see the entire project through to completion.

A list of more specific comments is attached. In conclusion, the Airports Authority supports rail in the Dulles Corridor as consistent with the Master Plan for Washington Dulles International Airport.

Sincerely,

for Richard Culbertson

Frank D. Holly, Jr.
Vice President for Engineering

Attachment

RCC:pp

ATTACHMENT 1

Specific Comments
Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation
Dulles Corridor Rapid Transit Project

1. The Airports Authority supports the concept of Premium Bus Service as an interim measure that would provide non-stop service on 15-minute headways between the Wiehle Avenue Station and the Main Terminal, Washington Dulles International Airport.

2. The establishment of construction staging areas on Airport property will need to be coordinated with the Airports Authority to ensure that adequate provisions are made to mitigate potential adverse effects on existing and planned uses of candidate sites.

3. The discussion of the proposed Route 28 Station (page 2-32 of the SDEIS) indicates that the DIAAH would need to be realigned to accommodate the proposed station, and that the Dulles Toll Road would need to be realigned to allow future construction of a third lane in each direction on the realigned DIAAH. The SDEIS declares that the "future effects of this widening are no longer assumed to be a direct effect of the Dulles Corridor Rapid Transit Project." The Airports Authority strongly disagrees with this assertion. In our August 27, 2002 comments on the Draft EIS, we stressed our future plans to widen the DIAAH to six lanes, and we emphasized the need for the Dulles Corridor Rapid Transit Project not to infringe on the right-of-way for the future widening. Realignment of the Toll Road to preserve this right-of-way is indeed a direct effect of the Dulles Corridor Rapid Transit Project, and the effects of this realignment need to be addressed in the EIS for the Dulles Corridor Rapid Transit Project.

4. Regarding the discussion of the Dulles Airport Historic District (page 3-33), the Airports Authority maintains that the eastern boundary of the eligible historic district does not extend east of the location on the DIAAH where westbound travelers are first able to view the Main Terminal and the original Air Traffic Control Tower.

5. Regarding issues to be resolved (page 10-5), it should be noted that the current Airport Layout Plan (ALP) for IAD dated February 2003 does include a rail alignment and a proposed rail yard on Airport property. Although the rail alignment shown on the ALP in the area northeast of the Main Terminal differs somewhat from that shown in the SDEIS, the Airports Authority is committed to working with the Virginia Department of Rail and Public Transportation to facilitate the FAA approvals necessary for the project.

METROPOLITAN WASHINGTON AIRPORTS AUTHORITY

AUG 27 2002

Mr. Corey W. Hill
Northern Virginia Regional Manager
Commonwealth of Virginia
Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Re: Draft Environmental Impact Statement
Dulles Corridor Rapid Transit Project

Dear Mr. Hill:

On behalf of the Metropolitan Washington Airports Authority (Airports Authority), I am pleased to provide support for the Dulles Corridor Rapid Transit Project and comment on the Draft Environmental Impact Statement. The Airports Authority has a very strong interest in providing the best possible access to Washington Dulles International Airport (Dulles) from throughout the Washington metropolitan region. Since the inception of Dulles more than 40 years ago, access has been a primary consideration as evidenced by the dedicated Dulles Corridor. The Federal Aviation Administration and subsequently the Airports Authority have planned for, acquired, and protected the median of the Dulles International Airport Access Highway (DIAAH) for the specific use of rail to Dulles.

Dulles continues to grow as a major international airport and the Airports Authority has not wavered in its vision to have a rail connection to the Nation's Capital. As part of that vision the Airports Authority supports the Draft Environmental Impact Statement alternatives that utilize the median of the DIAAH for rail, including phased implementation that provides for rail on a reasonable, predictable schedule. The Airports Authority recognizes that BRT could well be a part of such a phasing strategy. We do not, however, believe that BRT has the capacity to meet the long term needs of the region and the future growth of Dulles, and thus do not support it as a long-term solution to the corridor's transit needs.

The Airports Authority, as stewards of the Dulles Corridor, has an interest in optimizing the throughput of the corridor while maintaining access to Dulles. Accordingly, the Airports Authority would like to emphasize our future plans to widen the DIAAH to six lanes and the need for the Dulles Corridor Rapid Transit Project not to infringe on the right-of-way for this future widening. Also as we see a majority of this rail extension serving commuters, we have some concern whether adequate parking is being planned for in this project. The Airports Authority is prepared to make reasonable accommodations for commuters and commuter parking on airport property in the form of

the BRT maintenance facility, the Dulles North Transit Center, and future parking accommodations at the Route 606 Station. We are willing to consider siting the rail inspection and maintenance facility on Airport property provided there are no other reasonable and prudent alternatives. However, these regional commuter accommodations proposed on Dulles property represent the upper limit of what the Airports Authority may be willing to accept. To help realize the full potential of this rail extension, accommodations for additional parking beyond what is proposed in the draft EIS should be further considered.

As part of our review of the Draft Environmental Impact Statement we have prepared a list of more specific comments related to proposed facilities at Dulles. This list is offered as Attachment 1 for consideration as the project proceeds into further stages of development.

In conclusion, the Airports Authority supports rail in the Dulles Corridor, and is prepared to continue to help fulfill the vision created more than 40 years ago when Dulles was built.

Sincerely,

James A. Wilding
President and Chief Executive Officer

ATTACHMENT 1

Specific Comments on Draft Environmental Impact Statement (DEIS)

The Metropolitan Washington Airports Authority (Airports Authority) offers the following comments on the DEIS:

- The source of the IAD passenger projections for air travel presented in DEIS Section 1.2.2.4 needs to be identified. The figures do not agree with MWAA's unconstrained projections of passenger activity, which have been reviewed and approved by FAA. MWAA projects 37.9 million annual passengers (MAP) for 2010 and a build-out scenario of 65.7 MAP. Note that the term "million annual passengers" includes the sum of enplanements and deplanements, not simply "boardings" as stated in the DEIS.

- DEIS Section 3.4.3 on visual and aesthetic effects indicates that views of the IAD tower and Main Terminal from the Dulles International Airport Access Highway (DIAAH) would not be blocked by the east rail portal or by traction power substations; however, the DEIS does not discuss whether views would be affected by fencing or other barriers in the DIAAH median, particularly near Sully Road.

- The eligible historic district at IAD is substantially larger than that shown in Figure 7.3-1b, and includes the proposed location of the rail tunnel portal and elevated track northwest of the Main Terminal. The effects of these structures need to be addressed in the context of cultural resources and the Section 4(f) evaluation.

- As the development of the IAD Metrorail station would occur below grade, it would not have direct visual impact on the Main Terminal or historic district; however, this new facility would still technically fall within the historic district and the architectural design would need to take into account the general historic character of the airport. The original Saarinen plan included a careful consideration of both the inbound and outbound "passenger experience". As the new facility will become a new element of that experience, architectural sensitivity to the character of the airport will need to be addressed. Further consultation with the Airports Authority and the review agencies (under the terms of a Programmatic Memorandum of Agreement) would be required to assess potential effects and develop mitigation measures (if required).

- DEIS Figure 2.3-15 indicates the potential location of four traction power substations on airport property. Although it appears that two of these would be located in the north airport, one would be in the vicinity of the Main Terminal and one along the DIAAH. In both these location, the site selection and facility design will need to take into account potential visual impact on views of the Main Terminal complex and the architectural character of the historic district. It is anticipated that the MWAA Design Manual would dictate the design treatment in order to assure compatibility with the airport's other service structures.

- DEIS Section 4.2.3.5 states that the project is not in the coastal zone. It is our understanding that Fairfax County is part of the Virginia Coastal Zone, and that consistency with the Virginia Coastal Zone Management Plan should be addressed in the EIS.

Coordination Needs

Extensive continuing coordination is needed between the DCRTP design team and the Airports Authority throughout project design and construction to avoid potential conflicts between DCRTP and future IAD projects, and to minimize disruption during construction. The following is a list of technical comments related to the rail alignment, which the Airports Authority expects the project to address in the preliminary engineering stage:

- Preliminary engineering for this project should study the widening of the Dulles Airport Access Highway (DAAH) to six lanes in sufficient enough detail to determine what accommodations will be required to allow both projects to be accomplished.

- The western portal at station 1681+00 blocks ingress/egress to the Dulles Marriott Hotel and to Navigation Road at 1685+50. Consideration should be given to either relocating the portal further north or relocating Navigation Road and the Marriott access.

- The Airports Authority intends on preserving the right-of-way for future underground pedestrian connections to the Terminal from the vehicle parking north of the Terminal to remove pedestrian-vehicle conflicts and increase capacity of the commercial vehicle road. This pedestrian connection would be similar to the pedestrian connection that this project proposes to use for rail passengers to gain access to the Terminal. The current plans do not provide sufficient detail but it appears that the east portion of the Dulles Station and the #10 double crossover do not allow sufficient clearance between existing grade and the top of the station structure for the pedestrian connection to cross over the top of the station.

- The Airports Authority's expectation, though not specified in the documents, is that between both portals and the station, a tunneling construction method will be used which does not impact existing roads or facilities.

- Vertically, the Metrorail profile is in conflict with several of our proposed roadways, including EB-CD Rd., Ramp C and the entire Aviation Drive Ext./Rudder Rd. intersection. Each of these roadways have been set vertically to meet FAA airspace vertical clearances for Part 77 surfaces and proposed structures, so raising their profiles would not be feasible.

- The eastern portal at station 1590+00 is within the runway protection zone of runway 1R-19L. Accordingly, extensive coordination with the Airports Authority and FAA will be required and height restrictions will be imposed on cranes and equipment during construction.

- The Airports Authority has not yet determined the best location for a BRT stop/station at the Terminal Building. Though the general plans call for three bus parking positions at the easternmost end of the commercial vehicle curb, the Airports Authority's desire is to further study the best location for a BRT facility if a BRT system becomes part of the locally preferred alternative.

TS 93 Scoping Comments B-231-33

METROPOLITAN WASHINGTON AIRPORTS AUTHORITY

Ronald Reagan Washington National Airport ✈ Washington, DC 20001-4901

AUG 10 2000

Mr. Leonard Alfredson, P.E.
Dulles Corridor Rapid Transit Project
1550 Wilson Blvd., Suite 300
Arlington, VA 22209

RE: Environmental Impact Statement (EIS) Scoping Comments

Dear Mr. Alfredson:

The Metropolitan Washington Airports Authority (Authority) endorses the proposed Dulles Corridor Rapid Transit Project. Activity and development in the Dulles vicinity -- commercial, residential, and aviation -- are clearly some of the fastest growing in the country, and in our case at the airport, in the world. Reliable transportation and efficient mobility for the Dulles Corridor is essential for all parties, and this proposed program offers our best hope.

At your invitation, we offer the following for the record as our scoping comments:

Transit System Concepts

At the public scoping meetings there were comments to the effect that the EIS should consider an alternative involving multiple rail stops at Washington Dulles International Airport (Dulles); e.g., one stop at the Terminal and an employee stop farther north. While it may be appropriate for the Bus Rapid Transit (BRT) concepts, the Authority believes there should be only one airport rail station at Dulles. The Authority has a shuttle bus system for circulation on airport grounds. Moreover, we are concerned that an excessive number of stops will increase travel time and discourage ridership. 6.3.16

Regarding the second BRT stop at the airport, we will continue to work with you to establish a location that optimizes ridership and convenience.

In terms of public comments received that an airport rail station should be remote from the terminal, we believe such arrangements will significantly cut airport ridership. This conclusion can be demonstrated by comparing airports with existing at-terminal stations to airports with remote stations, and is consistent with conventional transit wisdom. The Authority believes that the airport station should be immediately adjacent to the terminal.

Some ability to operate multiple routes on the rail line with different eastern termini is of interest. For example, interlacing trains going into and through the District of Columbia with trains that terminate in Tysons Corner or on the Virginia portion of the Orange Line may yield system benefits. This requires some turn-back such as would be provided in the Tysons "loop" concept.

We believe that the Route 606 station, on airport property offers the only politically acceptable location for a major commuter park-and-ride facility for the western portion of the rail alignment, and that such a facility is vital to the healthy operation and effectiveness of the Dulles Rail line. It is on this basis that the Authority has cooperated with the concept of such a station and the establishment of the Western Regional Park-and-Ride lot. There have been other competing visions that have surfaced for this station that threaten airport development and the efficacy of the rail system. The Authority is strongly opposed to these alternative proposals. Any concept that fails to deliver a minimum of 6,000 to 7,000 automobile parking spaces in relative proximity to a Route 606 Station will fail to meet our mutual interests for a station at this location. We are amenable to working with the study team in Preliminary Engineering to optimize the station location so as to maximize the parking potential. To ensure that this facility is used for commuter parking for rail transit through the Corridor, and not for additional remote airport parking on the transit community's dollar, we recommend a ban on overnight parking. These overnight prohibitions are in place at many existing park-and-ride facilities.

Transit Maintenance and Storage Facilities

Regarding the concept of a significant on-airport development for transit maintenance and storage functions, that concept has been previously explored and proves problematic for a number of reasons. From an airport perspective, availability of land in the northern areas of Dulles is constrained by a number of factors. First, FAA rules establish runway protection zones which include Object-Free Areas (OFA) alongside and at the ends of runways, and Runway Safety Areas outside the OFAs, within which buildings are prohibited.

Second, the Dulles Land Use Plan, which is part of the FAA-approved Airport Layout Plan, reserves all available land north and east of the Terminal for uses that are essential to operation of the airport. The Land Use Plan also identifies runway protection zones for future runways.

Third, much of the undeveloped land on Dulles that is not subject to these restrictions contains wetlands. Because of these constraints the Authority believes it is unlikely that a suitable site for the proposed BRT/rail maintenance yard can be found on airport property in convenient proximity to the rail alignment.

A number of rail operational considerations also make airport locations undesirable; expert opinion on these issues can be found from some of the other agencies and from the Major Investment Study (MIS) investigations.

Environment – Visual Impacts

The Dulles Terminal is eligible for listing on the National Register of Historic Places. The historic district associated with the Terminal includes nearly all of the developed portions of the airport property between the Terminal and the airport hotel. In addition, the extreme western portion of the Dulles Access Highway has certain provisions protecting viewsheds toward the terminal. However, the Authority does not see a conflict between the historic designation and the proposed project because the Access Highway median has long been intended for rail transit use.

Terminal Area Facilities

Implementation of BRT at Dulles needs to be coordinated with the Authority to maintain vehicle and pedestrian traffic flow at the Dulles curb. Severing the curb in prime locations to provide a secured corridor between pre-ticketed passengers and the vehicles they are boarding will be impractical to the remainder of our operation.

The placement of the proposed Dulles Airport Metrorail station and tunnel will need to be coordinated with underground facilities planned for the airport. The most critical of these is a pedestrian tunnel connecting the terminal building and a parking garage planned for the north flank of the parking "bowl." This tunnel system is anticipated to be equipped with moving walkways. It is being designed to bridge open-cut construction for the rail station. The project, currently in advertisement for construction proposals, should be capable of allowing a three-track, two-platform station.

Consideration and provision for a future landside people mover is also a requirement at the Dulles rail station. Members of your team have graciously assisted us in developing a concept similar to that being built at San Francisco International Airport where the regional rail and the airport's landside people mover are vertically stacked together. This means the elevation of the airport's station will be lower than estimated in the MIS.

Regarding the construction of the rail station, we are very interested in any early information or opinion you can share regarding construction techniques and impacts anticipated for building the station immediately next to the terminal, and below this curb.

Other On-airport Facilities

The proposed rapid transit improvements need to be coordinated with the Authority's program to improve the airport road network. The road improvements could affect the routing of buses under the BRT alternative and the placement of Metrorail tunnel portals. 6.3.10

The EIS should compare the impacts of tunneling vs. cut-and-cover Metrorail construction methods on Dulles Airport traffic and operations. 6.3.16

The issue of alternative rail alignments adjacent to the rental car companies should be easily resolved early in the EIS process. We can discuss this with you at the next convenient technical meeting.

The Access Highway and Toll Road Corridor

Contrary to some statements made by others in the course of the scoping meetings, only some of the proposed median station locations in Fairfax County have been provided "bubbles" in the course of the design and construction of the eight-lane Dulles Toll Road. We believe that at least one, and perhaps two, stations will require reworking the Dulles Toll Road in order to accommodate the expected stations. If we are correct, the most complicated and expensive location to adjust will be at the proposed Herndon/Monroe Station. 6.2.10

The Access Highway will be widened to six lanes, probably within the decade. Preliminary Engineering for rail will need to consider the Access Highway in its six-lane configuration, not in its present four-lane section. 6.1.10

We are interested in having the EIS state a vision for the portion of the median adjacent to Tysons Corner in which no rail is designated at this time. We believe it may be prudent to continue to protect for rail in the median between Route 123 and Route 7 for a future use beyond the proposed project.

Policy and criteria for noise and noise walls along the Dulles Corridor are unique. They have been established in various Dulles Connector and Toll Road projects over the years. The Authority will be pleased to assist you as you define impacts and mitigation actions.

The Dulles Airport property, including the Dulles Access Road and the Dulles Connector, is owned by the U.S. Government (Department of Transportation) and leased to the Metropolitan Washington Airports Authority. An easement from the Authority or similar agreement will be required for the proposed project.

The Authority is considering your invitation to serve as a cooperating agency in the preparation of the EIS. Our senior management will make a decision in this matter during the next few weeks. In the interim, we have designated Dr. Charles Baummer of our Planning Department as the Authority's liaison with the Dulles Corridor Rapid Transit Project on the EIS. He can be reached at (703) 417-8168. Mr. Mike Hackett, also of Planning, will be our lead contact on Preliminary Engineering. His number is (703) 417-8164. Charlie and Mike will be each other's alternate on their respective assignments.

If you need additional information, please feel free to contact me at (703) 417-8160. We look forward to working with you on this worthy endeavor.

Sincerely,

William C. Lebegern

Re: Docket Number R03-6

Dear Mr. Rohrer:

The National Capital Planning Commission (NCPC) supports the efforts of the Washington Metropolitan Area Transit Authority (WMATA) and the Virginia Department of Rail and Public Transportation (VDRPT) to expand transit service in northern Virginia along the Dulles/Interstate-66 Corridor. As the central planning agency for the federal government in the National Capital Region, NCPC takes great interest not only in maintaining the quality of Federal development throughout the region, but also in preserving the quality of life for metropolitan area residents and visitors. We believe that reducing traffic congestion and improving air quality are major factors in enhancing regional quality of life, and that quality transit service is an important component of any solution to reach these goals.

The final preferred Metrorail extension to Dulles would greatly enhance general mobility within the Dulles/I-66 Corridor and provide an important regional transit linkage between Dulles Airport and the District of Columbia. The Public Hearings Report indicates that the Project Team will work with local governments to support and implement the Fairfax County and Loudoun County comprehensive plans, which contain guidelines to support transit, higher densities, mixed-use development, and pedestrian and bicycle friendly development patterns near transit stations. We are pleased that you share our vision of fostering transit-oriented development along the Dulles Corridor in order to ensure that future transit ridership is maximized. The comment responses contained in the Public Hearings Report show that the Project Team has been adequately responsive to our concerns regarding implementation of supportive station area transit-oriented development as part of the project.

We look forward to the release of the Final Environmental Impact Statement. Please let us know if we may be of any assistance to you in furthering this important project. If you have any questions regarding these comments, please direct them to Mr. Michael Weil, who may be reached at (202) 482-7253.

Sincerely,

William G. Dowd, P.E.

Re: Comments on Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement (DEIS)

Dear Mr. Hill:

Thank you for the opportunity to comment on the Dulles Corridor Rapid Transit Project DEIS. As the central planning agency for the federal government in the National Capital Region, the National Capital Planning Commission takes great interest in new transit projects in the region. In both its project review and planning roles, the Commission is focused strongly on smart growth and transit-oriented development. Our comments follow:

Whether the final preferred alternative is Bus Rapid Transit (BRT); Metrorail; a combination of BRT and Metrorail; or phased implementation, the project must include changes to land use policies and zoning that will support Transit-Oriented Development (TOD) in the project station areas. This should include higher allowable densities, a mix of uses, and compact walkable development patterns within a ½ mile radius of the stations. It is preferable that park and ride facilities not interfere with development of this area, particularly within the inner ¼ mile radius around the station. This area is better suited to pedestrian-scale development patterns. If parking facilities are located within this area, they should not be placed between the station and the immediately surrounding development and are best placed below ground. BRT stations and stops should be designed as if they were rail stations.

For portions of the project that will lie in freeway medians, air rights above the freeway right-of-way should be transferred and developed so that walkable uses can be placed within ¼ and ½ mile radii of the stations. The project should also include the design of supporting transit services such as shuttle buses from neighborhoods to the transit corridor and from the transit corridor to work and shopping activity centers.

We look forward to the release of the Final Environmental Impact Statement. If you have any questions regarding these comments, please direct them to Mr. David Levy of our staff at (202) 482-7247.

Sincerely,

William G. Dowd, P.E.

Re: Dulles Corridor Rapid Transit Project Draft EIS

Dear Mr. Rohrer:

The Northern Virginia Regional Commission staff has reviewed the document described above and has the following comments.

Please be advised that Fairfax County and the Town of Herndon have enacted jurisdiction-wide Chesapeake Bay Resource Management Area (RMA) designation. This RMA designation requires that all development result in a no-net-increase standard for phosphorus loadings, based on the jurisdiction's average imperviousness.

Special attention should be given to post-construction stormwater quality management. The developing agency must adhere to the **post-development** water quality requirements set forth by the Virginia Stormwater Management Regulations (VR 215-02-00 Part IV and §2.3). Meeting the Virginia Stormwater Management Regulations should comply with the requirement that state agencies meet the local ordinances pursuant to the Virginia Chesapeake Bay Act.

Please refer to the *Northern Virginia BMP Handbook* for calculation procedures. A copy of the handbook is available on NVRC's website, www.novaregion.org.

We would also suggest that, where possible, opportunities for retrofit of existing stormwater quantity facilities to stormwater **quality** facilities through new construction activities should be explored. NVRC's *Guidebook for Maintaining BMPs in Northern Virginia* is available, without charge, should you need it, and can also be downloaded from our website, or call me if you would like to receive a copy to use as a reference.

A copy of this letter should be included with your submission to indicate that the review by this agency has been completed.

Your cooperation in the intergovernmental review process is appreciated.

Sincerely yours,

James Van Zee
Director, Regional Planning Services

RE: Dulles Corridor Rapid Transit Project Supplemental Draft Environmental Impact Statement

Dear Mr. Rohrer:

We have reviewed the Supplemental Draft EIS and offer the following comments related to the W&OD Railroad Regional Park.

Section 7.3
The Supplemental Draft EIS states that at the W&OD Railroad Regional Park, access to the park would be maintained during hours of peak use. As stated in previous comments on the Draft EIS, it is Park Authority policy and the intent of the *Guidelines for the Development of W&OD Trail Bridge Crossings* that the trail is to remain open and safe at all times during bridge construction. Overhead protection for the trail, phased construction across the park property, trail detours, and other safety features will be required as necessary. Also, please confirm that construction access to the Toll Road easement area will be along the Toll Road and not along the W&OD paved or gravel trails.

We look forward to working with you to ensure that the proposed trail bridge meets our design requirements and that the trail remains open and safe during construction. Thank you for the opportunity to comment.

Sincerely,

Daniel Iglhaut
Land Administration and Planning Specialist

RE: Dulles Corridor Rapid Transit Project Public Hearings Report

Dear Mr. Hill:

We have reviewed the Public Hearings Report for the Dulles Corridor Rapid Transit Project Draft EIS and offer the following comment related to the W&OD Railroad Regional Park.

Section 7.3.2 states, "Any artificial lighting, which the Project might install, would be the maintenance responsibility of the park owners." Since the artificial lighting is proposed as mitigation for the project's negative visual and safety impacts on park property, its maintenance would be the responsibility of the project sponsor.

Thank you for the opportunity to comment. Please contact me at 703-359-4628 or at diglhaut@nvrpa.org if you have any questions or concerns.

Sincerely,

Daniel Iglhaut
Land Administration and Planning Specialist

RE: Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement

Dear Mr. Hill:

We have reviewed the Dulles Corridor Rapid Transit Project Draft EIS and offer the following comments related to the W&OD Railroad Regional Park.

Section 3.6.3.3
As stated in the Draft EIS, the planned widening of the Dulles Toll Road overpasses and the new bridge for Metrorail would nearly eliminate the existing light well between the existing overpasses resulting in "a visual impact to the trail." The Draft EIS states that the visual impact can be mitigated with the incorporation of natural and artificial lighting under the bridge. It should also be noted that elimination of the light well might result in safety and security impacts such as reduced visibility and crime. The Final EIS should address safety and security issues related to elimination of the light well and related mitigation, such as lighting and call boxes. Moreover, the Park Authority must be involved in the development of mitigation measures during all design phases.

Section 3.6.5.3
The Draft EIS states that construction would be timed for low-use periods and continued access to the park would be maintained during hours of peak use. The Draft EIS also states that construction would be in compliance with the Park Authority's Guidelines for the Development of W&OD Trail Bridge Crossings. It is Park Authority policy and the intent of the Guidelines that the trail is to remain open and safe at all times during bridge construction. Overhead protection for the trail, phased construction across the park property, trail detours, and other safety features will be required as necessary. Although not addressed in the Draft EIS, it is assumed that construction access to the Toll Road easement area will be along the Toll Road and not along the W&OD paved or gravel trails.

Section 7.4.3.12
As stated in the Draft EIS, the W&OD is a Section 6(f) protected property under the Land & Water Conservation Fund Act. In the early 1960's the federal government acquired an easement across the W&OD for the Toll Road overpass. However, rail uses do not appear to be included in the easement. Therefore, the Virginia Department of Conservation and Recreation has requested a determination from the National Park Service as to whether a conversion of use

would be required for construction of an additional overpass for Metrorail within the easement area. To date, a determination has not been made by the National Park Service. Therefore, the Draft EIS should not state, "no conversion of Section 6(f) land would occur." Regardless of whether or not a conversion is required, the Park Authority must review and approve, in writing, any new construction within the easement.

Thank you for the opportunity to comment. Please contact me at 703-359-4628 or diglhaut@nvrpa.org if you have any questions or concerns.

RE: PE/NEPA Scoping for Dulles Corridor Rapid Transit Project

Dear Mr. Alfredson:

We attended the pre-scoping session for the project and offer the following comments for consideration.

As you know, the Northern Virginia Regional Park Authority owns and operates the W&OD Railroad Regional Park. The 45-mile long park runs from Arlington County to Purcellville and is improved with multi-use trails within the former W&OD Railroad right-of-way. The W&OD provides an important recreational amenity for the region and a non-motorized transportation corridor that roughly parallels the Toll Road except where it crosses the Toll Road in Reston. Therefore, the Park Authority recommends that planners address connectivity from the proposed passenger stations to the W&OD for pedestrians and bicyclists.

The W&OD is a Section 6(f) protected property under the Land & Water Conservation Fund Act. In the early 1960's the federal government acquired an easement across the W&OD in Reston for the Dulles Toll Road overpass. Rail uses do not appear to be included in the easement. In the event the proposed rail line is established within the Toll Road, it may be necessary for the project sponsor to acquire additional easement rights from the Park Authority. Granting these rights may constitute a "conversion of use" under Section 6(f). A conversion of use would also be required if additional right-of-way is required within the W&OD. 6.6.6

The Park Authority also owns and operates Meadowlark Gardens Regional Park on Beuhlah Road near the Town of Vienna and Brambleton Regional Park near Beaverdam Reservoir in Loudoun County. Also, the Park authority is the state appointed administrator assisting the Goose Creek Scenic River Advisory Board to oversee activities along Goose Creek. Although it does not appear that the project will impact these resources, the Park Authority may have concerns if the proposed rail line is relocated outside the existing Toll Road right-of-way. 1.c

MR. KLINGE: Thank you, Delegate Plum. Next is Delegate Jim Scott.

MR. SCOTT: Thank you, Mr. Chairman, Madame Chairman, Supervisor Kaufman. It is a pleasure to be with you tonight. I am here wearing two hats. The first is representing the 53rd Legislative District which includes the West Falls Church and Dunloring Stations on the Orange Line and also representing the committee known as the House Joint Resolution 273 Committee which, as some of you know, is authorized by the General Assembly to begin work on interim improvements between now and then and the time of rail construction to the Tysons area.

I am also here tonight to ask you to listen carefully to constituents from the 53rd Legislative District, particularly those of two or three folks whom you have heard from before. I want to draw your attention particularly to the remarks of Mr. Clark Tyler from the Hallcrest Heights Civic Association whose concerns in support of the extension of rail to Dulles have to do with

the location of his community and the need for sound-mitigation measures which you have heard about on a number of occasions and I am grateful to say that Director Karen Ray has indicated that she will be addressing, through a coordinated effort on the part of the Commonwealth of Virginia and the other agencies.

Secondly, you will be hearing, I think, from Francesca Bravo who is the President of the West Hampton Civic Association who has made some comments about the revised EIS and will be addressing you, I believe, this evening. I think you have already received her remarks but, in case you haven't, I have a copy available for you.

Maybe a note of history might be useful tonight. Some of you realize that I was representing the Providence District when the Orange Line opened in 1986. It was actually my last official action as Providence Supervisor, as Chairman Hanley will recall. Before that took place, there were a lot of people who felt that it was not going to happen. There were a lot of

people who felt it shouldn't happen. There were a lot of people who were convinced it was happening in the wrong place.

But I draw your attention to the results. The Orange Line is now one of the most successful lines in the Metro system. There were people who suggested that the Vienna Station would never come about and, as a matter of fact, all we needed was buses down the Route 66 Corridor to solve all of our transportation problems.

We have seen that that was not the case then and I don't think it is the case now. I hope that you will not take temporary setbacks to mean anything but temporary setbacks and, in light of what has happened in the past, I am certain that you will be able to move this project forward as it deserves to be moved forward as one of our top priority projects for the addressing of our congestion problems in Fairfax County and in Northern Virginia.

Some final remarks in addition to calling your attention to the other speakers, I always try

to say that it is very important in each of my statements to remind those who will listen that non-motorized access to Metro stations remains a very high priority for not only my constituents but also for me, and I hope you will keep that in mind as you move forward with this project.

Finally, I want to just quote from a letter written to Mr. Rohrer from Ms. Francesca Bravo about the project a very supportive letter but one which draws attention to the need for some additional mitigation measures, and I quote; "There is no need to sacrifice the community for the greater good. With proper planning and coordination between agencies, this can be a win-win for all. In the context of a $3 billion rail and a $13 million Park-and-Ride facility, it seems that minor investment in sound walls, signs, speed bumps, to mitigate sound and visual pollution in traffic for adjacent areas is a small price to pay for community safety, health and good will."

Thank you very much.

MR. KLINGE: Thank you, Mr. Scott.

at

about it, but I think that, as we address those concerns, I hope that we will be able to complete our commitment that we made when we supported the local preferred alternative in the Corridor.

I would like to a moment, in that you have indicated that public officials have ten minutes; the Reston Association is a homeowner association of over 50,000 people Susie Jones is here to [illegible] able to incorporate as much time as possible for her to provide her testimony.

RECEIVED
DEC 17 2003

Thank you very much.

MS. HANLEY: Thank you.

MR. KLINGE: Thank you. Next is Delegate Ken Plum.

MR PLUM: Thank you very much and good evening. My name is Kenneth Plum. I welcome you to my neighborhood. I live two blocks down the street at 2073 Cobblestone Lane, Reston. I speak to you tonight as a member of the Virginia House of Delegates representing the 36th District but I also speak as Chairman of the Dulles Corridor Rail

Association. My remarks will be directed to the Supplemental Draft Environmental Impact Statement but I also want to just, by way of introduction, say a few comments about the project in general.

What I would want to say to you is that the Dulles Corridor project is very much alive in the hearts and minds and commuters in this region. The need for the project increases daily. You have the well-documented figures of the need already in the EIS. But those aren't just numbers. They are men and women trying to get to work each morning and they are people who are still out on the toll road tonight trying to get home to their dinner and to their families.

The choice of rail as the Locally Preferred Alternative was correct when it was made and the wisdom of that choice becomes even more clear as economic prosperity returns to the Corridor. Make no mistake; economic prosperity is returning to the Corridor.

But beyond rail as the Locally Preferred Alternative, I know I speak on behalf of the

citizens in my area who ask that we build Dulles Rail now. The Dulles Corridor Rail Association organized 20 groups as diverse as the Washington Board of Trade and the Sierra Club, the AAA and League of Women Voters, to say that we support Dulles Rail now. I will enter into your record the list of those 20 organizations.

But while tonight we are talking about the Supplemental Draft Environmental Impact Statement as a way to get Dulles Rail now, I would request that it be handled with all possible dispatch. Dulles Corridor Rail recognizes and acknowledges the necessity by the federal funding limitations and by the funding cycle that the project funding be done in phases.

We are pleased that the first phase of funding brings rail into the Corridor. We support that phase of funding as you have proposed in the Supplemental Draft EIS. We ask, however, that the funding phases not affect the construction schedule. In that regard, we request that the preliminary engineering be done for the entire

project and that the phasing of the financing be seamless in order that the construction be seamless.

The Dulles Corridor Rail Association supports a 23.1-mile project. As money becomes available for funding, the management of those funds and the planning for them to ensure that project--need to be done so that the project is built from the Orange Line to Route 772 in Loudoun as a seamless project.

In other words, make it clear that you do not intend to build to Wiehle and, at some later date, decide to finish the project. My hope is that when we go to the opening of the site at Wiehle that we are able to look west and see that, in fact, the construction is proceeding forward.

Delays in attempts to phase the construction would only add to its cost and would confuse the design and application of the stations. What I am saying to you, in other words, is that we recognize the reality. We are going to have to finance this thing in phases, but let's make sure

that those financing phases work together in a seamless fashion to that, in fact, construction can follow as well.

DCRA believes that the areas around the station should be left to local land-use decisions. Likewise, any designs around the station should involve a broad complement of the community actively involved in the design process. We have seen, I think, in the past, the wisdom of that community involvement.

To say that this is a very complex project is an oversimplification. It must go forward for the citizens of this region. But, just as the Supplemental EIS has worked out many design issues, so I know that the negotiations and actions over the next several weeks will make the project also financially viable.

We are pleased to support the Supplemental EIS and look forward to working with you in accomplishing that first phase of financing and construction and the total 23.1 miles.

Thank you very much.

Re: Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project

Dear Mr. Hill:

I am pleased to comment on the Draft Environmental Impact Statement and the Proposed General Plans for the Dulles Corridor Rapid Transit Project.

Unfortunately, I had to be out of town and was therefore unable to attend the public hearings on July 29-31. However, I was represented by my legislative aide, and I have reviewed testimony presented during the hearings.

Mass transit to Tysons Corner and to Dulles Airport is overdue. It is essential to the continued economic health of the region. It should be the top priority among major unfunded projects in the region.

Fortunately, there seems to be consensus that the necessary state, local and federal funding, along with substantial private funding, must be found to move the project to construction as soon as possible. Two important funding sources are within reach. Thanks to the initiative of the business community, LEADER has been created to help provide private funding. Governor Warner's leadership has put full funding for the local share before the voters this fall as a part of the sales tax referendum.

DISTRICT: (703) 560-8338 • RICHMOND: (804) 698-1053 • E-MAIL: DELJSCOTT@AOL.COM

Now we must move promptly to the next stage: selection of route and mode alternatives. Toward that end, I commend and support the work of the Dulles Rail Now!, the McLean Citizens' Association and Hallcrest Heights. I agree with their positions. I particularly call your attention to the MCA statement for its thoroughness in highlighting the importance of pedestrian and bus access to the Tysons' stations, as well as the need to mitigate the impact of construction and system noise on nearby communities and businesses. Ease of access by pedestrians, buses and bicyclists, including conformance with Fairfax County's County-wide Trail Plan, will be important measures of the success of our planning and implementation of this critical link in our transportation network.

In addition, I want to call your attention to the analysis and statements of one of MCA's constituent organizations: Hallcrest Heights, as well as citizens living in the Westhampton area. Their very legitimate concerns about immediate and long-term noise impacts deserve careful and prompt attention. Attached is a copy of a letter dated, August 21, 2002, from Mr. Clark Tyler. That letter details his community's concern about noise from construction and from transit operations. I concur with Mr. Tyler's request that Hallcrest Heights should receive the same level of noise attention measures as nearby communities adjacent to the Dulles Airport Access Road have already received. I also agree with his suggestion that noise attenuation measures to address the concerns of Hallcrest Heights and the Westhampton area citizens should be initiated before the construction of transit operations facilities. Please advise me of your plans in this regard.

Thank you for the opportunity to submit these comments for the record.

Sincerely Yours,

James M. Scott

RE: Hearing No. 147, Docket R02-1

Dear Mr. Hill:

I wish to add to a statement I submitted earlier at the Public Hearing on July 29. Since that time, the Transportation Committee (which I chair) of the McLean Citizens Association has passed and sent to you a resolution and extended comments on the Dulles Corridor EIS. One of the issues that came up during this process concerned not only the criteria for noise abatement at Hallcrest Heights, but the prospect of construction noise, whichever rail option is selected.

On these issues there are three points that we feel the EIS needs to more substantively address:

1. VDOT's noise criteria were judged not to apply because "no other roadway changes affecting either capacity or elevation are expected..." This is a narrow and not totally accurate viewpoint since both VDOT traffic projections and expectation for increased vehicle usage stemming from density allowances, will substantially increase traffic in the Dulles Connector section that adjoins our community. The EIS references plans to widen the connector, giving further indication of the prospect of increased vehicular traffic. The EIS should broaden its noise abatement scope to include both MWAA and VDOT policy as well as that of the FTA.

2. In light of #1 above, the EIS further references local ordinances on noise, but again narrowly excludes transit operations. The Policy Plan for the Comprehensive Plan of Fairfax County has as its objective (number 5) : "Minimize human exposure to unhealthful levels of transportation generated noise." It makes no distinction between vehicular and transit generated noise. In fact the local ordinance regulates new development, to ensure that people are protected from "transportation noise," and that noise impacts in areas of existing development should be reduced. The EIS needs to address noise mitigation in this light.

3. Although specifics are not given in the EIS, it is not hard to judge from precedents in other elevated sections of the Metro system, that construction noise will be considerable. Since our community lies some 10-12 feet below the level of the roadway in the corridor, the construction of the elevated and curving section of the proposed rail service into Tysons, will involve substantial and sustained construction noise over an extended period of time. Given the

FTA's policy of coordinated transportation planning (which I assume would include dealing with such public agencies as MWAA and VDOT), the EIS should sequence significant transportation noise mitigation measures in the corridor (and particularly our adjoining section) ahead of construction activities. Since VDOT has chosen not only to not maintain the existing ineffective barrier,(which is too low and too short anyway), and since MWAA has said that they will not retrofit any communities for such abatement, the EIS should address the problem in a comprehensive way if the project's objective to protect adjoining communities has any meaning at all. If the EIS were to include such analysis, then a noise barrier of modern design equivalent to that erected for Wolf Trap and other communities in the corridor should be placed at our section of the corridor. Such a barrier must extend all the way down the off-ramp to the merge with Route 123 if it is to have any effect at all.

Thank you for considering these additional points for inclusion in the record of decision for the Final EIS.

Sincerely,

Clark Tyler

Clark Tyler
President

only make congestion much worse. We cannot afford to be a victim of our own success. We cannot let the high quality of life that's attracted so many of us and the jobs to Fairfax County in the first place be undermined by that traffic congestion. We are on the verge of making the long-awaited vision of rail service to Tysons on the way to Dulles a reality. The time to take bold steps to solve the transportation problems has arrived, Mr. Chairman. Fairfax County and the Washington, D.C. region cannot afford to wait any longer.

Thank you.

[Applause.]

MR. KLINGE: The next speaker is the Honorable Kenneth R. Plum, member of the House of Delegates from Reston.

STATEMENT OF KENNETH R. PLUM

MR. PLUM: Mr. Chairman, members of the panel, I am here in three capacities. One is elected member of the Virginia House of Delegates representing the 36th District; secondly, as the convener of the Dulles Rail Now Coalition; and

RECEIVED
AUG 08 2002
By 15,940
0131 T

ar

third, chair of the Dulles Corridor Rail Association.

Let me first say in terms of the Dulles Rail Now Coalition, a coalition made up of AAA, Mid Atlantic, American Lung Association of Virginia, Coalition for Smarter Growth, Committee for Dulles, Dulles Area Transportation Association, Dulles Corridor Rail Association, Herndon-Dulles Chamber of Commerce, Leader Link National Wildlife Federation, Reston Association, Reston Citizens Association, Reston Interfaith Sierra Club, the Greater Washington Board of Trade, Washington Airports Task Force.

We, the organizations just mentioned, having studied the alternatives analyzed in the draft environmental impact statement of the Dulles corridor rapid transit project, recommend that the Commonwealth of Virginia select as a locally preferred alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future. To optimize ridership, continuing planning efforts should focus

on improving station access and transit-oriented development around the stations.

While we are testifying at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to a corridor of the region that is second only to the District of Columbia in terms of employment and contains several major activity centers.

Rail would serve Tysons Corner and is able to accommodate the projected growth in corridor transit trips. The coalition supports rail now. We will work with the region's elected leadership to bring rail to the Dulles corridor by 2010, sooner if feasible.

Now turning to my role a chair of the Dulles Corridor Rail Association, DCRA has been advocates for rail since we were organized four years in August of 1998. The analyses that have been done as part of the work preparing the draft EIS and the facts that emerged about the alternatives under study support our goal of seeing

rail adopted as the locally preferred alternative.

We urge the Commonwealth to reach agreement with the Dulles transit partners, the private sector team, to engineer and complete construction of the entire rail system as quickly as possible.

I will highlight just a couple of the major reasons why I say we should move forward with rail now.

First and foremost is the tremendous impact on the quality of life that rail transit will have for residents and employees in the corridor. People will be able to choose to take high quality, efficient rail transit service long envisioned for the corridor. Rail transit will enhance mobility and access to jobs and to cultural and educational facilities throughout the region. By providing a high capacity alternative to the single-occupant vehicle, we can use incentives in transportation measures to reduce vehicle miles of travel and improve air and water quality, a particularly important objective now.

Development in the corridor has proceeded more quickly than forecast. Twice as many jobs were created in the Dulles corridor as in the rest of the region over the last decade, fueling construction of office space.

Regional forecasts indicate that the corridor will continue to grow at nearly double the rate of the rest of the region in employment and residents, adding 206,000 people, an increase of 56 percent, and 203,000 jobs, a 71 percent increase in employment levels, over the next 25 years.

While vacancy rates and office space are high now, there is no doubt in my mind that this region will see the energy and entrepreneurship of our local business community lead us into new and promising directions that we will see business form and grow.

Another major reason for our support of rail in the corridor is the opportunity it provides to use transient-oriented development to create attractive neighborhoods and communities with a pedestrian focus, the kind of planning that has

made much of Reston a model of community scale development for the rest of the world.

Transit-oriented development provides opportunities to develop a variety of housing types for an increasingly diverse population and to reduce household expenditures on transportation.

A well-planned and mixed use in close proximity to the station is the key to generating rail ridership. To optimize ridership, we urge that the engineering studies for the station take into account the potential for air rights development as well.

With the addition of a fourth runway and other major airport improvements and passenger amenities, Washington Dulles International Airport is poised for significant growth. Forecasts for passenger trips for 2010 have been increased from 30 million to 37 million, an increase of more than 20 percent. Forecasts for 2025 have been increased from 55 to 63 million passenger trips.

The Dulles Center of the National Air and Space Museum will open in December 2003 and is

expected to generate three to five million visitors per year. While these visitors should be able to use transit, the growth of jobs in the hotel and restaurant and service industries will also bring additional employees and visitors to the area who could benefit from rail transit.

The rail alternative is projected to carry 9600 passengers per hour, compared with 2370 for bus rapid transit. Rail, with the ability to carry 50 to 60,000 passengers per hour, has the capacity over the long term to serve the growing trip demands in the corridor.

While the bus rapid transit alternative described in the draft EIS has a number of serious limitations, we think that there can and should be significant improvements to express bus service and passenger amenities in the interim, including the use of technology to enable prepayment before boarding, real time information about the location of buses, and more neighborhood and circular services.

We also suggest that with the adoption of

rail as the locally preferred alternative that the counties move forward with station access planning to ensure that station area development provides an enhanced bicycle and pedestrian access facility as well as feeder bus services.

The engineering for rail should allow for future air rights development. And finally, the final financial plan for using toll road revenues provides the opportunity to explore several innovative pricing strategies, including incentives to switch to the fast toll transponder to improve roadway capacity, high occupancy toll lanes, whereby single drivers can use the hot lanes for a price, the cost of which is determined by a pricing structure that controls congestion.

Let the record show that before the yellow light came on, I completed my testimony, and for those reasons, we recommend the adoption of the rail option.

Thank you, Mr. Chairman.

[Applause.]

MS. KAUFFMAN: Thank you, Delegate Plum.

McCandlish at the registration table at this time so that we can accommodate you.

If you wish to provide comments and do not want to speak at tonight's hearing, I encourage you to fill out the comment form, write us a letter, or send us an e-mail. We will be accepting comments until the public comment period closes on August the 28th.

And as we said earlier, if you want to testify and not have to hang around, we have a court reporter outside who will take your testimony and that becomes part of the public record.

And I shall now introduce the public officials who are here to testify and each will get 10 minutes to speak.

The first speaker is the Honorable Kenneth R. Plum.

STATEMENT OF THE HONORABLE KENNETH R. PLUM

MR. PLUM: Thank you very much, Mr. Chairman, members of the panel, ladies and gentlemen. My name is Kenneth R. Plum. I live two blocks down the street at 2073 Cobblestone Lane

RECEIVED
AUG 09 2002
By 16.026

0163

here in Reston.

I don't intend to take my full 10 minutes, so everyone can relax.

I am here to speak as an elected official representing this community in the Virginia House of Delegates. I am also here to speak as a convener of a coalition and also as chair of the Dulles Corridor Rail Association.

You are aware that yesterday we announced -- and I want to make the public here aware -- that we announced yesterday the convening of a coalition called Dulles Rail Now. That coalition is made up of the following organizations:

Triple AA Mid-Atlantic, American Lung Association of Virginia, the Coalition for Smarter Growth, the Committee for Dulles, the Dulles Area Transportation Association, the Dulles Corridor Rail Association, Herndon-Dulles Chamber of Commerce, LEADER, LINK, the National Wildlife Federation, the Reston Association, Reston Citizens Association, Reston Interfaith, Sierra Club, the Greater Washington Board of Trade, the Washington

Airports Task Force.

The organizations I have just listed issued a statement yesterday saying that having studied the alternatives analyzed in the draft environmental impact statement of the Dulles corridor rapid transit project, recommends that the Commonwealth of Virginia select as the locally preferred alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future.

While we may, speaking of the organizations that I have listed, testify at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to a corridor of the region that is second only to the District of Columbia in terms of employment and contains several major activity centers.

The statement goes on to say the coalition supports rail now. We will work with the region's elected leadership to bring rail to the Dulles corridor by 2010, sooner if feasible.

Turning now to my statement as chair of the Dulles Corridor Rail Association, I know that you heard at the public hearing last evening and will probably hear some say again tonight, why are we in such a hurry on this project?

Well, I would say to you as someone who has worked on the project for more than 25 years, I would ask why has it taken so long?

The truth of the matter is the concept of this project goes back some 40 years. In the last several years there has been an active history of public involvement, studies by professionals and others, to bring us to this very pivotal point. And this is a pivotal point, I think, for the project and for the quality of life of our community.

We have problems to solve and they include, among other things, congestion, air quality, growth. But we want to, I would suggest to you, simply not solve these problems for today, we want to solve them for the long-term future.

I would say to you that I speak today also

in another capacity, in that of being a grandfather. My son Christopher, sitting here on the front row, and I want us to solve the problems not simply for me and for us today, but for Christopher and the other people who will live in our communities in the future.

Furthermore, as a public official, I know we all share the interest that we get the maximum value for the public monies we spend. We don't want to in the short run simply be cheap. Cheap such that we make a solution today and we have to multiply that in the future. In the long run we have ended up spending more money, inconvenienced a number of people. We need to go forward with a working solution for the long run.

The Dulles Corridor Rail Association recommends the rail option now. It responds to our needs today, but most importantly, it provides a key element for a quality future for our communities in the corridor.

Rail enhances our mobility in the corridor and eases access to jobs, but it also, and I think

importantly, opens the region to a myriad of cultural and educational programs that are available throughout the area.

Rail also responds to the phenomenal growth expected in this corridor; 56 percent in population and 71 percent in employment by 2025. With a capacity to carry 50 to 60,000 passengers maximum per hour, rail can in the future not simply meet the needs of today, but it can meet the needs of tomorrow.

Rail will help us meet the needs of a rapidly expanding Dulles airport, where passenger trips forecast for 2010 have been increased from 30 million to 37 million.

Rail will help meet the demands of the National Air and Space Museum, which is expected to generate 3 to 5 million visits per year.

Local governments are to be complimented for the express bus system it has put in place. It is a form of bus rapid transit. It should be increased and enhanced. But future plans should be directed to the rail alternative, using express bus

in the interim.

Likewise, future planning needs to build upon the pioneering work already completed in Fairfax and Loudoun Counties to amend their comprehensive plans. That planning calls for rail stations with maximum access and flexibility for riders and transit-oriented development around the stations.

But for the decision before us tonight, that decision being the locally preferred alternative, the Dulles Corridor Rail recommends that we move to rail now.

Finally, I would ask that the record indicate that I used four minutes and 22 seconds of my 10 minutes.

Thank you.

MR. KLINGE: Thank you.

[Applause.]

MR. KLINGE: Now I'd like to introduce the mayor of the city of Falls Church, the Honorable Daniel E. Gardner.

STATEMENT OF THE HONORABLE DANIEL E. GARDNER

registration table at this time so that we can accommodate you.

If you wish to provide comments and do not want to speak at tonight's hearing, I encourage you to fill out a comment form, write us a letter, or send us an e-mail. We will be accepting comments until the public comment period closes at 5 p.m. on August the 28th.

I would also remind you that we have a court reporter in the hall who can take your statement if you so choose.

I shall now introduce the public officials here present to testify. They will each have 10 minutes to speak, and the first is the Honorable Kenneth R. Plum, member of the Virginia House of Delegates and chairman of the Dulles Corridor Rail Association.

RECEIVED
AUG 14 2002
y 14,161

STATEMENT OF THE HONORABLE KENNETH R. PLUM

MR. PLUM: Thank you, Mr. Chairman, and distinguished panel, ladies and gentlemen.

I want to start by thanking the panel for indulging me at the last two public hearings for

the last two evenings, and I will be brief tonight. But I also want to take a moment to thank you for the very professional manner in which these hearings have been conducted, the support that you have given to the public to understand what the questions are before us, the accommodations, aside from the air conditioning last evening, which no one had planned on. We have had, I think, a very successful series of hearings. Again, my thanks and my compliments to you for that.

I am here again this evening because I want to make sure my message is very clear. I am an elected official involved in the study of this project in various forms for almost 25 years. I come to you tonight as an elected official saying that from my studies and my conclusions, looking at the alternatives proposed, I recommend that we choose as the locally preferred alternative the rail option.

Likewise, as an organizer with others of the Dulles Rail Coalition Now, I want to bring to you a statement brought forth by a number of

organizations supporting again the rail option.

And finally, as Mr. Klinge had mentioned, I chair a group called the Dulles Corridor Rail Association, and likewise our analysis says that we should go to the rail option.

Back just a moment to the Dulles Rail Now Coalition, that coalition is made up of the following organizations:

Triple AAA Mid Atlantic, the American Lung Association of Virginia, the Coalition for Smarter Growth, the Committee for Dulles, Dulles Area Transit Transportation Association, Dulles Corridor Rail Association, the Herndon-Dulles Chamber of Commerce, LEADER, LINK, the National Wildlife Federation, Reston Association, Reston Citizens Association, Reston Interfaith, Sierra Club, the Greater Washington Board of Trade, the Washington Airports Task Force.

Because this is a statement bringing together many diverse groups, I am going to ask you to indulge me again for just a couple of seconds as I read through the prepared statement. The

organizations I have just listed have studied the alternatives analyzed in the draft environmental impact statement of the Dulles corridor rapid transit project, and recommend that the Commonwealth of Virginia select as the locally preferred alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future.

While the organizations in the coalition will testify at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to the corridor of the region that is second only to the District of Columbia in terms of employment, and contains several major activity centers.

We applaud Fairfax and Loudoun Counties for adopting comprehensive plans in 2001 that support increased mixed use development around the rail stations.

We recognize that much work needs to be done to realize the walkable mixed use communities

envisioned by the transit-oriented development criteria in the plans and to make the rail extension a reality.

We support rail now. We will work with the region's elected leadership to bring rail to the Dulles corridor by 2010, sooner if feasible.

Then in my capacity as chairman of the Dulles Corridor Rail Association, as I indicated, we are a membership organization made up of business and community leaders. We likewise have looked at the alternatives proposed in the project study. We unequivocally support the rail option now.

Patty Nicoson, the president of the Dulles Corridor Rail Association, will testify a little later tonight and she will talk about some continued concerns we have about the planning as it relates to an access of individual stations, but the point being is that among these various groups, along with the Dulles Corridor Rail Association, we respectfully request that we go to the locally preferred alternative of rail.

RE: Noise impact on Hallcrest Heights community

Dear Mr. Dittmeier:

Over a year ago (May, 2001), Mr. Clark Tyler, President, Hallcrest Heights Associates, Inc. sent you a copy of a letter (enclosed) written by Mr. Michael A. Staiano, an acoustical engineer advising the Hallcrest Heights homeowners on the potential noise impact of the Dulles Corridor Rapid Transit Project. The letter makes recommendations to mitigate noise and suggests they be considered in the planning process. Mr. Tyler requested a response from you. Since he never heard from you, he sent another copy of the letter on February 28, 2002.

I am a strong supporter of public transit for Northern Virginia, including the Dulles Corridor Rapid Transit Project. I also think a major project such as this one requires the serious consideration of citizens' concerns. Please reply to Mr. Tyler's letters (May 2001 and February 2002) as soon as possible and send me a copy.

Thank you.

Sincerely yours,

Jim Scott

Dear John:

You may recall that after our meeting with you and Len in May 2001, I followed up with a letter from our acoustical engineer, Mike Staiano, relative to the concept of "parallel barriers." Have your engineers considered this in their preliminary work? Because it has been some time, I am enclosing another copy of Mike's letter and would be interested in any reaction from your team.

It is my understanding that the draft EIS will be available sometime this spring with hearings to follow sometime early this summer. Is that still the timetable?

Thanks for your interest.

Sincerely,

Clark Tyler

Subject: Meeting with WMATA Representatives re
Dulles Corridor Rapid Transit Project

Dear Clark:

I thought that our 17-May meeting at the County Board of Supervisors offices regarding the noise concerns of the Hallcrest Heights homeowners was productive. The WMATA representatives appeared to be forthcoming and reasonable. There is one matter that upon consideration of the likely project description in the vicinity of your community I believe should be addressed by WMATA as they perform their noise assessment: Where the Metrorail right-of-way rises above grade adjacent to your development, the vertical retaining walls and elevated structure will create sound-reflecting surfaces parallel to the existing highway noise barrier. Reflections from the railway structures may degrade the barrier performance in the manner of "parallel barriers." The significance of this should be examined and mitigation incorporated if necessary. (Mitigation can be accomplished by various means, the simplest of which is absorptive treatment of the vertical surfaces.)

If you have any questions, let me know.

Sincerely,

Michael A. Staiano

August 18, 2002

Mr. Corey W. Hill
Northern Virginia Regional Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Dear Mr. Hill:

The purpose of this letter is to inform you of my views on the Draft Environmental Impact Statement for the Dulles Corridor Rapid Transit Project.

Having studied the alternatives analyzed in the study, I strongly support Metrorail to Dulles Airport and Loudoun County as the locally preferred alternative. This alternative will provide both the highest transit ridership and the highest number of new riders, resulting in a higher percentage of people using transit. More commuters will benefit from shorter travel times than other alternatives. The best option is to build rail the full length of the project from the beginning. Most people living in my Senate district, which extends from McLean to the Loudoun County border, clearly prefer this alternative. They view rail as an attractive way to commute. They also want to have the entire system at the earliest possible date.

However, there are numerous concerns in the community that I wish to emphasize.

It is completely inappropriate to increase tolls on the Dulles Toll Road to pay for the construction of rail. Commuters in the Corridor have been paying for the Dulles Toll Road for the past eighteen years. No other Virginians north of Richmond have been subjected to tolls. A typical commuter driving to work in D.C. from Reston fifty weeks a year is paying $375 each year. If that commuter has lived here for eighteen years, he has already paid $6750!

In addition, these same commuters have paid for construction of the Metrorail system for the rest of the Washington Metropolitan area.

The proposals in the Draft EIS that would increase tolls either $0.50 or $0.25 in 2003 and then an additional $0.25 every three years until 2015 are neither fair nor equitable. As the Draft EIS demonstrates, the benefits of rail to Dulles are extensive and far-

reaching, accruing to the entire metropolitan region and the state as a whole. To expect commuters paying increased tolls to generate between $725 and $800 million in funding for construction is unreasonable and simply wrong. These ill-conceived proposals to raise tolls should be discarded immediately.

Fortunately, there is an alternative. A portion of the undesignated funds that will be generated if the transportation referendum passes could be earmarked for this purpose.

Insufficient attention is being paid to mitigating the impact of rail on adjoining communities. Communities that are already suffering from inadequate abatement of noise from the Toll Road must be guaranteed that they will finally receive sufficient mitigation measures. Of particular concern is Hallcrest Heights in McLean, which has had only a deteriorating, dilapidated wooden barrier to stop the noise. Given that the proposal is for an elevated, curving rail structure to adjoin the community, they urgently need attention. However, noise is a serious concern for communities along the entire length of the proposed rail system and must be addressed responsibly.

Although viewed mainly as a business center, Tysons Corner is also a major residential area. The preferences of the residents of the Rotunda and other established residential communities deserve special consideration. The goal is to improve the quality of life for residents in the corridor; no one's quality of life should suffer as a result.

Special sensitivity is needed in the design of the Reston stations to encourage bridging the Corridor, which currently severs the community. The design of rail stations should further the goal of linking the opposite sides of the corridor. The station designs should not preclude the possibility of air right linkages across the Dulles Corridor.

To avoid disruption of communities and to encourage rail usage, adequate structured parking as well as pedestrian and bicycle access are required system-wide.

Careful planning for the related land use impacts is essential. Rail will bring dramatic changes to the area – whether these are positive or negative will depend on the land use planning. This is an unprecedented opportunity to implement "smart growth" principles throughout the Corridor. Both Fairfax and Loudoun Counties have adopted Comprehensive Plans that support increased mixed-use development around the rail stations. Careful coordination of land use and transportation plans, with extensive public participation, needs to continue and take the highest priority.

Like the vast majority of residents and businesses in my district, I enthusiastically embrace the prospect of Rail Now to Dulles. And I look forward to assuring that it is done right.

Sincerely yours,

Janet Howell

RE: Dulles Corridor Rapid Transit Project

This letter is in response to your request concerning threatened or endangered plant or insects species in the vicinity of the proposed rapid transit project along Route 267 from the communities of Pimmit Hills in Fairfax County to Ryan in Loudoun County, VA. To date, Virginia Department of Agriculture and Consumer Services records indicate that no threatened or endangered plant or insect species have been documented in the area indicated in communications you provided. We do not anticipate significant adverse impacts upon plant or insect species under our jurisdiction to result from this project. However, the absence of data does not necessarily mean that no listed species occur in the area, but that our files do not currently contain information to document their presence.

The Virginia Department of Agriculture and Consumer Services has jurisdiction only over plant and insect species listed as threatened or endangered. To better serve citizens and agencies of the Commonwealth, the Virginia Departments of Agriculture and Consumer Services and Conservation and Recreation have entered into an agreement for the review of projects within Virginia. Future requests for information concerning endangered and threatened plants and insects should be directed to the Natural Heritage Division of the Department of Conservation and Recreation for initial evaluation. Projects found to demonstrate potential impact on these species will be referred to the Department of Agriculture and Consumer Services for further review and possible mitigation. Additional information on unique geologic formations, rare or critical habitat, and rare and candidate species can be obtained from VDCR/NH. The Virginia Department of Game and Inland Fisheries has jurisdiction over similarly listed endangered and threatened animal species.

Sincerely,

Keith R. Tignor
Endangered Species Coordinator

Re: W &On Railroad Regional Park and nulles Corridor Rapid Transit Project Land and Water Conservation Fund (L&WCF) Projects #51-00186, #51-00221, and #51-00282

Dear Mr. Fenton:

After consultation with the National Park Service, we have determined that the proposed Dutles Corridor Rapid Transit Project will not constitute a conversion ofuse under the L&WCF Act. This determination is based on the fact that the metro rail overpass location will be within an existing transportation easement that now has an existing four-lane highway overpass.

We **are confident the Park Authority will mitigate the metro rail construction** in **accordance with the items that were addressed** in **the Environmental Impact Statement, and that the project will not impede the nonnal trail use by the citizens ofNorthem Virginia.**

Thank you for keeping us **informed about the** W **&OD Trail. This trail is** a **valuable national asset and** a **"star" for the L&WCF Program.**

Sincerely, 4~

Re: Docket Number R02-1-Dulles Corridor Rapid Transit Project Public Hearings Report

Dear Mr. Hill:

The Department of Conservation and Recreation (DCR) has previously submitted comments on the Dulles Corridor Rapid Transit Project. After review of the "Public Hearings Report for the Draft Environmental Impact Statement and General Plans for the Dulles Corridor Rapid Transit Project", the DCR's Division of Natural Heritage DCR-DNH would like to offer the following comments:

1) According to the response comment documented on the top of page 209, Coastal Resources conducted a survey for rare, threatened and endangered plants in April and August of 2002 and the survey results indicated no species were found. DCR-DNH would like to review this survey report before it is included in the Final Environmental Impact Statement to verify all potential sites within the study area were surveyed for rare plants and verify the survey was conducted during the appropriate time of year. DCR-DNH is concerned that the rare diabase plant, earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), may have been missed in the August survey due to the difficulty in identifying the plant in its vegetative state. The actual flowering period for this plant is September.

2) Also the reference to "Mr. Lugwig" in the response comment should be corrected to " Mr. Ludwig".

3) Please send the survey results to Rene Hypes, Project Review Coordinator-Division of Natural Heritage, Department of Conservation and Recreation, 217 Governor Street, 2nd Floor, Richmond, Virginia 23219.

Thank you for the opportunity to review the public hearings report.

Sincerely,

Derral Jones

Subject: **2003 General Erosion & Sediment Control Specifications**

Dear Sir/Madam:

On behalf of the Virginia Soil & Water Conservation Board, the Virginia Department of Conservation and Recreation (DCR) requests Erosion & Sediment Control (ESC) Specifications for 2003 for your company per Section 10.1-563 of the Virginia Erosion & Sediment Control Law. The deadline for submitting these specifications is **September 15, 2002**. Land-disturbing activities planned for the remainder of 2002 will still operate under previously approved 2001 ESC Specifications.

The enclosed "Virginia Linear Land-Disturbance Guidance" provides detailed information on the regulation and submittal requirements. Please forward your completed documents to **Kelly Ramsey, Urban Programs Engineer, DCR, 203 Governor St., Ste. 206, Richmond, Virginia 23219.**

Additionally, please provide updated company contact person information along with your ESC Specifications, and route this letter to the appropriate engineer or regulatory person within your company.

Please contact Kelly Ramsey above at (804) 371-7440 or e-mail LinearProjects@dcr.state.va.us, if you have questions or require assistance. Website information concerning erosion and sediment control, including the enclosed guidelines, is available at www.dcr.state.va.us/sw.htm.

Thank you in advance for attending to this matter.

Sincerely,

Lawrence J. Gavan
Manager, Urban Programs

Encl.

DCR

Department of Conservation & Recreation

CONSERVING VIRGINIA'S NATURAL AND RECREATIONAL RESOURCES

VIRGINIA LINEAR LAND-DISTURBANCE GUIDANCE FOR UTILITY, PIPELINE, AND RAILROAD COMPANIES

I. Regulated and Exempt Linear Activities

The Virginia Erosion and Sediment Control Law (VESCL) defines a land-disturbing activity as any land change of 10,000 square feet or greater that involves clearing, grading, excavating, transporting, and filling of land. The Department of Conservation and Recreation (DCR) regulates linear land-disturbance projects undertaken by utility, pipeline, and railroad companies. However, non-linear land-disturbance such as municipal utility, building and facilities construction are regulated by the appropriate locality. Section 10.1-563D of VESCL requires electric, natural gas and telephone utility companies, interstate and intrastate natural gas pipeline companies to submit Erosion and Sediment Control (ESC) Specifications that will apply to linear land-disturbance to DCR for review and approval.
Linear projects regulated by DCR are:

1. Construction, installation, and maintenance of electric, natural gas, and telephone utility lines and pipelines.
2. Construction of railroad tracks, rights-of-way, bridges, buildings, and facilities
3. Access roads, staging areas, and borrow/spoil sites associated with a linear project

Exempt linear projects are:

1. Projects less than 10,000 square feet (2,500 square fee in Tidewater Region, generally east of Interstate 95)
2. Individual service connections
3. Underground public utility lines installed, repaired, or maintained on an existing hard-surfaced road, street, or sidewalk
4. Installation of fencing, sign posts, posts, or poles
5. Repairs to existing railroad tracks, rights-of way, bridges, and facilities
6. Purchasing time on existing lines (no land-disturbance)

II. Minimum Requirements for ESC Specifications Submittal

ESC Specifications explains and illustrates the erosion and sediment control measures to be used during linear, project-specific construction. The following information is required in the ESC Specifications Submittal:

1. Include ***Virginia Erosion and Sediment Control Handbook*** **(*Handbook*)** standard details and symbols that will be employed.
2. ESC practices not specified in the *Handbook*, such as trench plugs and directional drilling, shall describe in narrative format how the measures meet the 19 Minimum Standards. *(Ref. §4VAC50-30-50)*, and detailed as represented on construction plans (standard detail, symbol and notes)
3. Provide Project-Specific Information on all linear projects planned to be constructed in 2003. Include the following information:
   a. Project Name (or Number)

b. Project Location (including nearest major intersection)
c. On-site project manager name and contact information
d. Responsible Land Disturber name, certification number, and contact information (Section 10.1-563 and 10.1-566)
e. Project Description (including disturbed acreage estimate and projected start and finish dates)

4. Define the company's obligations to ensure self-inspection, reporting, training, certification, environmental protection, and safety
5. Information concerning projects not included in the ESC Specifications should be emailed to DCR at LinearProjects@dcr.state.va.us.

III. Variance Requests

Modifying or waiving any of the ESC regulations, including the 19 Minimum Standards, on a project-specific basis, requires companies to submit a written Variance Request to DCR for review and approval. A typical project that requires a Variance is projects that open more than 500 feet of trench at one time (Minimum Standard 16). The recommended protocol for submitting Variance Requests is as follows:

1. Provide a project-specific ESC plan. An ESC plan explains and illustrates the control measures to be used during project-specific construction and shall include soil, topographic information, drainage divides, ESC details, and ESC notes
2. Provide project-specific justification that the proposed ESC plan meets the intents of the 19 Minimum Standards.
2. Define the company's obligations to ensure self-inspection, reporting, training, environmental protection, and safety as required by DCR as a condition of approval
3. Present strategies for informing and educating contractors of the Variance requirements
4. Variance Requests should be emailed to DCR at LinearProjects@dcr.state.va.us well in advance of project start

Variance Requests included in the ESC Specifications should be confined to linear activity. For example, Minimum Standard 6 (Sediment traps and Basins) generally does not apply to linear projects, therefore a Variance is not needed.

IV. Compliance

DCR Regional Office staff periodically inspects linear projects covered under the ESC Specifications, and the Virginia Soil and Water Conservation Board may undertake enforcement action if a project is out of compliance. Linear companies are urged to periodically inspect their projects routines (in some cases, regular inspection is a condition of approval). DCR also recommends pre-construction conferences with contractors, sub-contractors, land-developers, consultants and right-of-way users to communicate clearly the approved ESC practices.

V. Additional Information

This document and the ***Virginia Erosion and Sediment Control Handbook*** **(*Handbook*)** is available at DCR's website, www.dcr.state.va.us/sw/e&s.htm. Questions regarding linear project land-disturbance may be directed to Kelly A. Ramsey at (804) 371-7440 or kramsey@dcr.state.va.us.

January 16, 2002

Mr. John Dittmeier
Washington Metropolitan Area Transit Authority
1550 Wilson Blvd., Suite 300
Arlington, VA 22209

Re: Dulles Corridor Rapid Transit Project

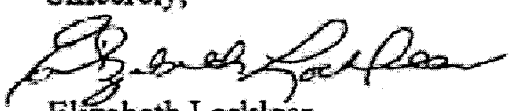
Dear Mr. Dittmeier:

The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered species, unique or exemplary natural communities, and significant geologic formations.

According to the information currently in our files, several rare plants, which are typically associated with prairie vegetation and inhabit semi-open diabase glades in Virginia, may occur at this location if suitable habitat is present. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia counties and is located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plants occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction (Rawinski, 1995).

In Northern Virginia, diabase supports occurrences of several global and state rare plant species: earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), white heath aster (*Aster ericoides*, G5/S2/NF/NS), blue-hearts (*Buchnera americana*, G3G4/S1/NF/NS), hairy beardtongue (*Penstemon hirsutus*, G4/S2/NF/NS), downy phlox (*Phlox pilosa*, G5T5/S2/NF/NS), stiff goldenrod (*Oligoneuron rigidum* var. *rigidum*, G5/S2/NF/NS), and marsh hedgenettle (*Stachys pilosa* var. *arenicola*, G5/S1/NF/NS). Please note that earleaf foxglove is currently tracked as a

species of concern by the United States Fish and Wildlife Service (USFWS); however this designation has no official legal status.



Due to the potential for this site to support populations of natural heritage resources, DCR recommends an inventory of suitable habitat in the study area. With the survey results we can more accurately evaluate potential impacts to natural heritage resources and offer specific protection recommendations for minimizing impacts to the documented resources.

DCR-Division of Natural Heritage biologists are qualified and available to conduct inventories for rare, threatened, and endangered species. Please contact J. Christopher Ludwig, Natural Heritage Inventory Manager, at (804) 371-6206 to discuss arrangements for field work. A list of other individuals who are qualified to conduct inventories may be obtained from the USFWS.

Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks other natural heritage resources. DCR's Biological and Conservation Data System is continuously revised. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

Should you have any questions or concerns, feel free to contact me at 804-692-0984. Thank you for the opportunity to comment on this project.

Sincerely,

Elizabeth Locklear
Locality Liaison

Dulles Corridor Transit Project
1550 Wilson Blvd, Suite 300
Arlington, VA 22209

1 Feb 2001

Re: Dulles Corridor Rapid Transit Project

Dear Mr. Alfredson:

The Department of Conservation and Recreation (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

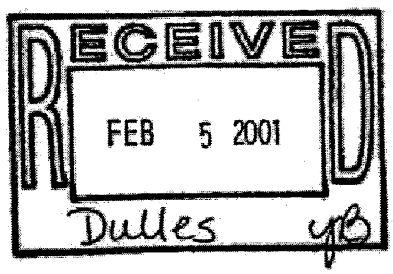
Based on a review of the topographic and soil maps, the project area may contain diabase glade habitat. Several rare plants typically associated with prairie vegetation inhabit semi-open diabase glades in Virginia. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia counties and is located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plants occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction (Rawinski, 1995).

In Northern Virginia, diabase supports occurrences of several global and state rare plant species: earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), white heath aster (*Aster ericoides*, G5/S2/NF/NS), blue-hearts (*Buchnera americana*, G3G4/S1/NF/NS), hairy beardtongue (*Penstemon hirsutus*, G4/S2/NF/NS), downy phlox (*Phlox pilosa*, G5T5/S2/NF/NS), stiff goldenrod (*Oligoneuron rigidum* var. *rigidum*, G5/S2/NF/NS), and marsh hedgenettle (*Stachys pilosa* var. *arenicola*, G5/S1/NF/NS). Please note that earleaf foxglove is currently tracked as a species of concern by the United States Fish and Wildlife Service (USFWS); however this designation has no official legal status.

DCR understands that the majority of the proposed facility will be constructed in the median and the remainder is in the highly developed Tysons Corner area. For this reason, DCR does not

anticipate that this project will adversely impact diabase glade habitat and associated rare plants.

The wood turtle (*Clemmys insculpta*, G4/S2/NF/LT) has also been documented in the project vicinity. The wood turtle inhabits forested floodplains and nearby fields, wet meadows, and farmlands (Mitchell, 1994). As this species overwinters on the bottoms of creeks and streams, a primary habitat requirement is the presence of water (Mitchell, 1994). Please note that the wood turtle is classified as threatened by the Virginia Department of Game and Inland Fisheries (VDGIF). To minimize adverse impacts to the wood turtle's aquatic habitat, DCR recommends the implementation of and strict adherence to erosion and sediment control measures during all phases of this project.



Under the Memorandum of Agreement established between the Virginia Department of Agriculture and Consumer Services (VDACS) and the Department of Conservation and Recreation (DCR), DCR has the authority to report for VDACS on state-listed plant and insect species. The current activity will not affect any documented state-listed plants or insects.

Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks natural heritage resources. New and updated information is continually added to BCD. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

Should you have any questions or concerns, feel free to contact me at 804-692-0984. Thank you for the opportunity to comment on this project.

Sincerely,

Robbie Barbuto
Locality Liaison

Mr. Len Alfredson, Project Manager 7/17/00
Washington Metropolitan Area Transit Authority
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Re: Dulles Corridor Rapid Transit Project

Dear Mr. Alfredson:

The Department of Conservation and Recreation (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

Based on a review of the topographic and soil maps, the project area may contain diabase glade habitat. Several rare plants typically associated with prairie vegetation inhabit semi-open diabase glades in Virginia. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia counties and is located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plants occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction (Rawinski, 1995).

In Northern Virginia, diabase supports occurrences of several global and state rare plant species: earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), white heath aster (*Aster ericoides*, G5/S2/NF/NS), blue-hearts (*Buchnera americana*, G3G4/S1/NF/NS), hairy beardtongue (*Penstemon hirsutus*, G4/S2/NF/NS), downy phlox (*Phlox pilosa*, G5T5/S2/NF/NS), stiff goldenrod (*Oligoneuron rigidum* var. *rigidum*, G5/S2/NF/NS), and marsh hedgenettle (*Stachys pilosa* var. *arenicola*, G5/S1/NF/NS). Please note that earleaf foxglove is currently tracked as a species of concern by the United States Fish and Wildlife Service (USFWS); however this designation has no official legal status.

DCR understands that the majority of the proposed facility will be constructed in the median and the remainder is in the highly developed Tysons Corner area. For this reason, DCR does not anticipate that this project will adversely impact diabase glade habitat and associated rare plants.

The wood turtle (*Clemmys insculpta*, G4/S2/NF/LT) has also been documented in the project vicinity. The wood turtle inhabits forested floodplains and nearby fields, wet meadows, and farmlands (Mitchell, 1994). As this species overwinters on the bottoms of creeks and streams, a primary habitat requirement is the presence of water (Mitchell, 1994). Please note that the wood turtle is classified as threatened by the Virginia Department of Game and Inland Fisheries (VDGIF). To minimize adverse impacts to the wood turtle's aquatic habitat, DCR recommends

the implementation of and strict adherence to erosion and sediment control measures during all phases of this project.

Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks natural heritage resources. New and updated information is continually added to BCD. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

From the information provided in the scoping packet, it is difficult to discern the "project authority" for this project, i.e., the Washington Metropolitan Area Transit Authority, or the Virginia Department of Rail and Public Transportation. Therefore, we assume that this project is a multi-jurisdictional local project or is being conducted by a state agency. In the event that this project is not conducted across multiple local jurisdictions or is not undertaken by a state agency, the applicant should contact DCR's Division of Soil and Water Conservation (DSWC) for further information.

In general, however for issues of soil and water conservation, all railroad construction projects that involve a land-disturbing activity of over 10,000 square feet must prepare a project-specific Erosion and Sediment Control (ESC) plan for review and approval by DCR's DSWC. An approved plan is required prior to initiation of any land-disturbing activity at the project site. All plans must be prepared in accordance with the Virginia Erosion & Sediment Control Handbook, Virginia Erosion & Sediment Control Law (VESCL) and Regulations (VESCR). ESC plans should be submitted directly to the DCR Watershed Office that serves the area where the project will be undertaken. *[Ref: VESCL §10.1-560, §10.1-563.A, §10.1-564; VESCR §4VAC50-30-30, VESCR §4VAC50-30-100]*

Similarly, all projects that involve a land clearing, soil movement, or construction activity of over one acre must prepare a project-specific Stormwater Management (SWM) plan for review and approval by DCR's DSWC. An approved plan is required prior to initiation of any regulated activities at the project site. However, please note that railroad and other linear development projects may be exempt from this requirement provided that (i) less than one acre of land will be disturbed per outfall or watershed, (ii) there will be insignificant increases in peak flow rates, and (iii) there are no existing or anticipated flooding or erosion problems downstream of the discharge point. The applicant may contact DSWC for assistance in determining whether a SWM plan is required for this project. Notwithstanding, plans must be prepared in accordance with the Virginia Stormwater Management Act (VSWMA) and Regulations (VSWMR). SWM plans should be submitted directly to the DCR Watershed Office that serves the area where the project will be undertaken. *[Ref: VSWMA §10.1-603.5 and §10.1-603.8.B.5; VSWMR §4VAC-3-20-210 - 245].*

Enclosed for use in directing project-specific plans and technical and regulatory inquiries to the appropriate DCR Watershed Office is a copy of the guidance document titled, *DCR/DSWC Urban Programs Information & Contacts.*

For your records, the proposed project is not anticipated to have any adverse impacts on existing or planned recreational facilities. Nor will it impact any streams on the National Park Service Nationwide Inventory, Final List of Rivers, potential Scenic Rivers or existing or potential State Scenic Byways.

Sincerely,

Derral Jones

Definition of Abbreviations Used on Natural Heritage Resource Lists of the Virginia Department of Conservation and Recreation

Natural Heritage Ranks

The following ranks are used by the Virginia Department of Conservation and Recreation to set protection priorities for natural heritage resources. Natural Heritage Resources, or "NHR's," are rare plant and animal species, rare and exemplary natural communities, and significant geologic features. The primary criterion for ranking NHR's is the number of populations or occurrences, i.e. the number of known distinct localities. Also of great importance is the number of individuals in existence at each locality or, if a highly mobile organism (e.g., sea turtles, many birds, and butterflies), the total number of individuals. Other considerations may include the quality of the occurrences, the number of protected occurrences, and threats. However, the emphasis remains on the number of populations or occurrences such that ranks will be an index of known biological rarity.

S1 Extremely rare; usually 5 or fewer populations or occurrences in the state, or may be a few remaining individuals, often especially vulnerable to extirpation.

S2 Very rare; usually between 5 and 20 populations or occurrences; or with many individuals in fewer occurrences; often susceptible to becoming extirpated.

S3 Rare to uncommon; usually between 20 and 100 populations or occurrences; may have fewer occurrences, but with a large number of individuals in some populations; may be susceptible to large-scale disturbances.

S4 Common; usually >100 populations or occurrences, but may be fewer with many large populations; may be restricted to only a portion of the state; usually not susceptible to immediate threats.

S5 Very common; demonstrably secure under present conditions.

SA Accidental in the state.

S#B Breeding status of an organism within the state.

SH Historically known from the state, but not verified for an extended period, usually > 15 years; this rank is used primarily when inventory has been attempted recently.

S#N Non-breeding status within the state. Usually applied to winter resident species.

SU Status uncertain, often because of low search effort or cryptic nature of the element.

SX Apparently extirpated from the state.

SZ Long distance migrant whose occurrences during migration are too irregular, transitory and/or dispersed to be reliably identified, mapped and protected.

Global ranks are similar, but refer to a species' rarity throughout its total range. Global ranks are denoted with a "G" followed by a character. Note that GA and GN are not used and GX means apparently extinct. A "Q" in a rank indicates that a taxonomic question concerning that species exists. Ranks for subspecies are denoted with a "T". The global and state ranks combined (e.g. G2/S1) give an instant grasp of a species' known rarity.

These ranks should not be interpreted as legal designations.

Federal Legal Status

The Division of Natural Heritage uses the standard abbreviations for Federal endangerment developed by the U.S. Fish and Wildlife Service, Division of Endangered Species and Habitat Conservation.

LE Listed Endangered - threatened with extinction throughout all or a significant portion of its range
LT Listed Threatened - likely to become endangered in the foreseeable future
PE Proposed Endangered
E(S/A) Treat as endangered because of similarity of appearance
PT Proposed Threatened
T(S/A) Treat as threatened because of similarity of appearance
C Candidate - enough information is available to propose for listing, but listing is Precluded by other pending proposals of higher priority
SOC Species of Concern -- species that merit special concern (not a regulatory category)
NF No federal legal status

State Legal Status

The Division of Natural Heritage uses similar abbreviations for State endangerment.

LE Listed Endangered
LT Listed Threatened
PE Proposed Endangered
PT Proposed Threatened
C Candidate
SC Special Concern -- animals that merit special concern according to VDGIF (not a regulatory category)
NS No state legal status

For information on the laws pertaining to threatened or endangered species, contact:
U.S. Fish and Wildlife Service for all FEDERALLY listed species
Department of Agriculture and Consumer Services Plant Protection Bureau for STATE listed plants and insects
Department of Game and Inland Fisheries for all other STATE listed animals

K.3.5 Commonwealth of Virginia, Department of Environmental Quality

- December 18, 2003
  - Participating agencies:
    - Department of Environmental Quality
    - Department of Agriculture and Consumer Services
    - Department of Conservation and Recreation
    - Marine Resources Commission
    - Department of Historic Resources
    - Chesapeake Bay Local Assistance Department
    - Northern Virginia Regional Commission
    - Loudoun County
    - Town of Leesburg
- October 28, 2002
- August 27, 2002
  - Participating agencies:
    - Department of Environmental Quality
    - Department of Conservation and Recreation
    - Department of Transportation
    - Marine Resources Commission
    - Department of Historic Resources
    - Department of Mines, Minerals, and Energy
    - Department of Forestry
    - Chesapeake Bay Local Assistance Department

Mr. Karl A. Rohrer, AICP
Project Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

RE: Supplemental Draft Environmental Impact Statement for the Dulles Corridor Rapid Transit Project
DEQ-03-210F

Dear Mr. Rohrer:

The Commonwealth of Virginia has completed its review of the above document (hereinafter "SDEIS"), which is a National Environmental Policy Act ("NEPA") document prepared jointly by the Department of Rail and Public Transportation, the Washington Metropolitan Area Transit Authority, and the Federal Transit Administration. The Department of Environmental Quality is responsible for coordinating Virginia's review of federal environmental documents and responding to appropriate federal (and, in this case, state) officials on behalf of the Commonwealth. The following agencies, planning district commission, and localities participated in this review:

Department of Environmental Quality (hereinafter "DEQ")
Department of Agriculture and Consumer Services
Department of Conservation and Recreation
Marine Resources Commission
Department of Historic Resources
Chesapeake Bay Local Assistance Department
Northern Virginia Regional Commission
Loudoun County
Town of Leesburg

In addition, the following agencies and localities were invited to comment:

Department of Game and Inland Fisheries
Department of Health
Department of Transportation
Department of Forestry
Department of Aviation
Department of Rail and Public Transportation (proponent agency)
Arlington County
Fairfax County (indicated its intent to respond by the deadline)
City of Falls Church
Town of Herndon
Town of Vienna.

Project Description

The Federal Transit Administration, the Washington Metropolitan Area Transit Authority, and the Virginia Department of Rail and Public Transportation, with the cooperation of the Federal Aviation Administration, are proposing alternative transit improvements in the Dulles Corridor. This corridor runs from the East Falls Church Metrorail station in Fairfax County past Tyson's Corner to Dulles Airport and into Loudoun County.

The Draft EIS, published in the summer of 2002 (reviewed under DEQ-02-124F, comments mailed August 27, 2002), analyzed five alternatives (Supplemental Draft EIS, page 2-1, section 2.1):

- "No-Build," meaning the existing situation and planned projects through the year 2025;
- Bus Rapid Transit (BRT), meaning a bus-based system, with separate bus stops and stations, and three alignment options;
- Metrorail, meaning extension of the Metrorail system, and several alignment and service area options;
- BRT/Metrorail, meaning a combination of the two alternatives above; and
- Phased implementation, combining the foregoing three alternatives into a program of improvements implemented in stages (i.e., BRT, then BRT/Metrorail, then Metrorail).

The Supplemental Draft EIS (hereinafter "SDEIS") analyzes the following alternatives (page 2-3, section 2.2):

- The "baseline" or "no-build" alternative consists of the existing highway and transit infrastructure and services, and any that are committed for implementation by the year 2025.

- Metrorail Alternative: The Metrorail system would be extended from a point between the East and West Falls Church stations to State Route 772, by way of a number of track and station alignment options, and ancillary facilities would be included. There would be 11 new stations, bus routes feeding into stations, and regional routes running the length of the corridor.

- Proposed Locally Preferred Alternative: Facilities for the Locally Preferred Alternative (LPA) would be similar to those for the Metrorail Alternative. The differences would be in phasing and other aspects of operation and design.

Environmental Impacts and Mitigation

1. Natural Heritage Resources. The Department of Conservation and Recreation (DCR) has searched its Biotics Data System (formerly the Biological and Conservation Data Base) for occurrences of natural heritage resources in the project area. "Natural heritage resources" are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, significant geologic formations, and similar features of scientific interest. Natural heritage resources have been documented in the project area. However, due to the scope of project activity and the distance to the resources in question, DCR does not anticipate that the project, as proposed, would adversely affect natural heritage resources.

Under a memorandum of agreement between DCR and the Department of Agriculture and Consumer Services (VDACS), DCR represents VDACS in commenting on potential impacts of projects on state-listed plant and insect species. The proposed project will not affect any documented state-listed plants or insects. The Department of Agriculture and Consumer Services, which has jurisdiction over state-listed endangered and threatened plants and insects, confirms this statement.

DCR also reports that no state natural areas under its jurisdiction are in the project vicinity.

2. Air Quality. DEQ's Air Division reiterates its earlier guidance relative to open burning and fugitive dust emissions. The Division also continues to recommend restricting emissions of volatile organic compounds and oxides of nitrogen because the project will take place in an ozone non-attainment area and an emissions control area for volatile organic compounds and oxides of nitrogen, the precursors to atmospheric ozone.

3. Water Quality. DEQ's Water Division commends the project proponents for planning to construct rail lines primarily within the medians of existing roads, because this approach is a helpful strategy for the avoidance of impacts to surface waters, among other things. Other ways to minimize impacts include completely spanning wetlands and streams, and shifting the alignment.

(a) Stream and Wetland Impacts. Unavoidable stream and wetland impacts will require full compensatory mitigation, as explained in the SDEIS (pages 4-12 through 4-15, section 4.2.3), including permanent conversion from one wetland type to another of lesser value. Examples of avoidance and minimization include completely spanning wetlands and streams. DEQ's Water Division recommends strict adherence to erosion and sediment control practices and stormwater management requirements (see item 5, below), and effective monitoring of construction activities to ensure that erosion controls and stormwater management practices are adequately preventing sediment and pollution from entering adjacent surface waters. Adherence to state and local erosion and sediment control and stormwater management requirements (see item 5, below) will help minimize short-term water quality impacts from this project. See "Regulatory and Coordination Needs," item 1, below.

In general, DEQ recommends that stream and wetland impacts be avoided to the maximum extent practicable. For unavoidable impacts, DEQ encourages the following practices to minimize project impacts to wetlands and waterways:

- Operate machinery and construction vehicles outside of stream-beds and wetlands; use synthetic mats when in-stream work is unavoidable;
- Erosion and sedimentation controls should be designed in accordance with the most current edition of the *Virginia Erosion and Sediment Control Handbook*. These controls should be in place prior to clearing and grading, and maintained in good working order to minimize impacts to State waters. The controls should remain in place until the area is stabilized. (See also item 5, below.)
- Place heavy equipment, located in temporarily impacted wetland areas, on mats, geotextile fabric, or use other suitable measures to minimize soil disturbance, to the maximum extent practicable.
- Restore all temporarily disturbed wetland areas to pre-construction conditions and plant or seed with appropriate wetlands vegetation in accordance with the cover type (emergent, scrub-shrub, or forested). The project proponents should take all appropriate measures to promote re-vegetation of these areas. Stabilization and restoration efforts should occur immediately after the temporary disturbance of each wetland area instead of waiting until the entire project has been completed.
- Place all materials which are temporarily stockpiled in wetlands, designated for use for the immediate stabilization of wetlands, on mats, geotextile fabric in order to

prevent entry into State waters. These materials should be managed in a manner that prevents leachates from entering state waters and must be entirely removed within thirty days following completion of that construction activity. The disturbed areas should be returned to their original contours, stabilized within thirty days following removal of the stockpile, and restored to the original vegetated state.

- All non-impacted surface waters within the project or right-of-way limits that are within 50 feet of any clearing, grading, or filling activities should be clearly flagged or marked for the life of the construction activity within that area. The project proponents should notify all contractors that these marked areas are surface waters where no activities are to occur.
- Measures should be employed to prevent spills of fuels or lubricants into state waters.

Loudoun County indicates its support for the federal goal of no net loss to wetlands. The County will identify optimum receiving sites for wetland mitigation, with a priority given to each geographic Policy Area (see the County's Revised General Plan, Policy 23). Therefore, the County prefers that any wetland impacts from the proposed project be mitigated within the Suburban Policy Area. However, if a wetland mitigation bank is not available in that Area at the time the impacts are incurred, then County staff prefers that impacts in Loudoun County be mitigated at the Bull Run Wetland Bank (SDEIS, Figure 4.2-2, following page 4-12).

(b) Loudoun County Planning Considerations. In connection with the discussion of water resources and mitigation of water resource impacts (SDEIS, pages 4-3 and 4.4, section 4.2), Loudoun County points out that its adoption of the Revised 1993 Zoning Ordinance in 2003 included establishment of a River and Stream Corridor Overlay District, which implements many of the policies outlined in the Revised General Plan. The River and Stream Corridor Overlay District identifies resources of concern and planning considerations. River and Stream Corridor Resources include:

- rivers and streams draining 100 acres or more
- 100-year floodplains (major and minor)
- adjacent steep slopes (i.e., 25% or greater, starting within 50 feet of streams and floodplains, extending no farther than 100 feet beyond the originating stream or floodplain)
- a 50-foot Management Buffer surrounding floodplains and adjacent steep slopes
- wetlands, forests, historic and cultural resources, and archaeological sites that fall within the area of one or more of the above resources

In addition, a 300-foot no-build buffer or the River and Stream Corridor Overlay District, whichever is greater, will be applied to scenic rivers, the Potomac River, Bull Run, and

the protected shoreline of drinking water reservoirs (see the County's Revised General Plan, Policies 1, 8, and 11).

The SDEIS lists coordination with local jurisdictions on mitigation for non-conformity of any project within critical areas as an available option (page 4-12, section 4.2.3). The County staff considers such coordination to be a requirement for any element of a project affecting a River and Stream Corridor Overlay District. See "Regulatory and Coordination Needs," item 6, below.

4. Solid and Hazardous Waste Management. According to DEQ's Waste Division, solid and hazardous waste issues were addressed in the SDEIS. DEQ's Waste Division did a cursory review of its data files and did not find any additional contamination sites that might affect, or be affected by, the project.

Pollution prevention was not addressed in the SDEIS. DEQ encourages the proponents to implement pollution prevention principles, including the reduction of solid wastes at the source, re-use of materials, and recycling of waste materials. (See item 9, below, for additional guidance on pollution prevention.).

5. Erosion and Sediment Control; Stormwater Management. Federal agencies and their authorized agents conducting regulated land-disturbing activities on public and private lands in the Commonwealth of Virginia must comply with the Virginia Erosion and Sediment Control Law (*Virginia Code* section 10.1-567), the Virginia Stormwater Management Law (*Virginia Code* section 10.1-603.15), and other applicable federal non-point source pollution control mandates such as section 313 of the Clean Water Act and the federal consistency requirements of the Coastal Zone Management Act. Clearing and grading activities, installation of staging areas, parking lots, roads, buildings, utilities, or other structures, soil/dredge spoil areas, or related land conversion activities that disturb 2,500 square feet or more (in Chesapeake Bay Preservation Areas, as defined; see Virginia's Chesapeake Bay Preservation Area Designation and Management Regulations, 9 VAC 10-20-10 et seq., specifically 9 VAC 10-20-70 through 10-20-105 or consult with the appropriate locality's planning department) are regulated by the Erosion and Sediment Control Law (*Virginia Code* section 10.1-567) and its implementing regulations. Similar activities that disturb one acre or more are regulated by the Stormwater Management Law (*Virginia Code* section 10.1-603.5) and its implementing regulations. Accordingly, the project proponents should prepare and implement Erosion and Sediment Control Plans and Stormwater Management Plans that comply with state law. The project proponents are ultimately responsible for achieving project compliance through oversight of on-site contractors, regular field inspection, prompt action against non-compliance, and/or other mechanisms consistent with agency policy. See "Regulatory and Coordination Needs," item 3, below.

Special attention should be given to post-construction stormwater quality management, according to the Northern Virginia Regional Commission. The project proponents must adhere to the post-development water quality requirements set out in the Virginia Stormwater Management Regulations (4 VAC 30-30 through 4 VAC 30-100). If these requirements are met, the proponents will thereby meet the requirement that state agency projects comply with local ordinances pursuant to the Chesapeake Bay Preservation Act (*Virginia Code* sections 10.1-2100 et seq.). The *Northern Virginia BMP Handbook* has calculation procedures for stormwater quality requirements; the proponents may obtain a copy through the Regional Commission's web site, www.novaregion.org.

The Regional Commission also recommends that the proponents explore opportunities, where possible, for retrofit of existing stormwater quantity facilities to stormwater quality facilities through new construction activities. The Regional Commission's *Guidebook for Maintaining BMPs in Northern Virginia* is also available from the website, or it can be obtained from the Commission without charge. See "Regulatory and Coordination Needs," item 3, below.

6. Historic Structures and Archaeological Resources. According to the SDEIS, the proposed Locally Preferred Alternative would not give rise to adverse effects upon architectural resources in the project area (see Table 3.5-2, page 3-34). The Department of Historic Resources, in a letter to the Virginia Department of Rail and Public Transportation dated November 19, 2003, indicated that it could not concur with this statement, because it had not reviewed the information that gives rise to the conclusion; the SDEIS cites "further analysis" as confirming a conclusion that views in the "peekaboo" sequence would be effectively mitigated (see SDEIS, page 3-33, section 3.5).

The "peekaboo" sequence refers to the repeated appearances of the Dulles Airport Terminal to motor vehicle drivers and passengers traveling west toward the Airport on the Dulles Access Highway. According to the Department of Rail and Public Transportation, the first (easternmost) of these views no longer exists because of intervening building construction (Holma/Ellis, 12/17/03). At a December 16 meeting involving the Department of Historic Resources (DHR) and project proponents, the proponents recommended defining the second such view (farthest east of the Airport of the remaining three views) as the eastern boundary of property potentially eligible for the National Register of Historic Places and the Virginia Landmarks Register. This boundary would be at the line where the first view of the Airport Terminal appears to the westbound driver. DHR is awaiting further analysis of this recommendation by the proponents. See "Regulatory and Coordination Needs," item 5, below.

DHR does agree with the proponents' suggestion to revise the Area of Potential Effect from 1000 feet on either side of the transit system centerline (and 1000 feet from

related construction, such as transit stations) to 600 hundred feet from the transit centerline and around transit stations (Holma/Ellis, 12/18/03).

Loudoun County points out that the SDEIS described the Area of Potential Effect as 200 feet beyond station footprints to allow for possible variation during construction (see Figures 3.5-1a and 3.5-1b, following page 3-28). The County should be contacted if variations in the proposed alignment will affect additional sites. In addition, the County should continue to be a consulting party as impact mitigation strategies are discussed. See "Regulatory and Coordination Needs," item 5, below.

7. Chesapeake Bay Preservation Areas. According to the Northern Virginia Regional Commission, Fairfax County and the Town of Herndon have enacted jurisdiction-wide Chesapeake Bay Resource Management Area (RMA) designations. This designation requires that all development result in a no-net-increase standard for phosphorus loadings, based on the jurisdiction's average imperviousness. In addition, since a Resource Management Area is one of two classifications of a Chesapeake Bay Preservation Area, the threshold for application of the Erosion and Sediment Control Plan is 2,500 square feet of land disturbance, rather than 10,000 square feet in areas not so designated. See item 5, above.

As the Chesapeake Bay Local Assistance Department indicated in reviewing the Draft EIS (its comments dated July 31, 2002, with our reply to the Draft EIS, dated August 27, 2002 (DEQ-02-124F, pages 7-8), road and railway projects are conditionally exempt from the requirements of the Chesapeake Bay Preservation Area Designation and Management Regulations (9 VAC 10-20-10 et seq.) provided such projects are constructed, operated, and maintained in accordance with the Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Act (or an equivalent local program). This conditional exemption also requires that road alignments and design prevent or otherwise minimize (i) encroachment in Resource Protection Areas, as defined in the Regulations, and (ii) adverse effects on water quality. Non-linear features of the project, such as parking lots and stations, are not exempt and must be consistent with the General Performance Criteria and the Development Criteria for Resource Protection Areas. (The General Performance Criteria and the Development Criteria are found in the Regulations, respectively, at 9 VAC 10-20-120 and 9 VAC 10-20-130.) During planning and design phases, site-specific surveys should be conducted to verify the presence or absence, and boundaries, of any Resource Protection Areas.

8. Recreation Facilities and Resources. In the judgment of the Department of Conservation and Recreation, the SDEIS does a thorough job of addressing the impacts of crossings of the Washington and Old Dominion (W&OD) Trail. It should be noted that a planned future greenway/trail in the area is not addressed in the SDEIS. That trail, the Fairfax Cross-Country Trail, is to connect Great Falls National Park with Fort

Belvoir. The transit corridor will cross this trail corridor; accordingly, the proponents should consider, and provide accommodation for, this trail in final plans. See "Regulatory and Coordination Needs," item 6, below.

9. Pollution Prevention. As we stated in our reply to the Draft EIS, dated August 27, 2002 (DEQ-02-124F, page 9, item 11), DEQ advocates that principles of pollution prevention be used in all construction projects as well as in facility operations. Effective siting, planning, and on-site Best Management Practices (BMPs) will help to ensure that environmental impacts are minimized. However, pollution prevention techniques also include decisions related to construction materials, design, and operational procedures that will facilitate the reduction of wastes at the source. We have several pollution prevention recommendations that may be helpful in constructing or operating this project:

- Consider development of an Environmental Management System (EMS). An effective EMS will ensure that the proposed facility is committed to minimizing its environmental impacts, setting environmental goals, and achieving improvements in its environmental performance. DEQ offers EMS development assistance and recognizes facilities with effective Environmental Management Systems through its Virginia Environmental Excellence Program.
- Consider designs, techniques, and technologies that will facilitate the re-circulation and re-use of waters used for cooling and steam generation. These techniques can save money by minimizing intake and treatment needs.
- Consider environmental attributes when purchasing materials. For example, the extent of recycled material content, toxicity level, and amount of packaging should be considered and can be specified in purchasing contracts.
- Consider contractors' commitments to the environment (such as an EMS) when choosing contractors. Specifications regarding raw materials and construction practices can be included in contract documents and requests for proposals.
- Choose sustainable materials and practices for infrastructure and building construction and design. These could include asphalt and concrete containing recycled materials, and integrated pest management in landscaping, among other things.
- Integrate pollution prevention techniques into facility maintenance and operation, to include the following: inventory control (record-keeping and centralized storage for hazardous materials), product substitution (use of non-toxic cleaners), and source reduction (fixing leaks, energy-efficient HVAC and equipment). Maintenance facilities should be designed with sufficient and suitable space to allow for effective inventory control and preventive maintenance.

DEQ's Office of Pollution Prevention provides free information and technical assistance relating to pollution prevention techniques and EMS. If interested, the project proponents may contact that Office (Tom Griffin, telephone (804) 698-4545).

10. Local and Regional Comments.

(a) Northern Virginia Regional Commission. See items 5 and 7, above.

(b) Loudoun County. Loudoun County has corresponded directly as well as with this Office regarding the SDEIS. The issues not reflected herein (see items 3 and 6, above, and "Regulatory and Coordination Needs," items 5 and 6, below) pertain to additional planning considerations and/or to corrections in the document; see the attached comments from the County (December 15, 2003 letter).

(c) Towns of Leesburg, Herndon, and Vienna. Leesburg indicates no comment.

Regulatory and Coordination Needs

1. Water Resources Permitting. A Virginia Water Protection Permit will be required for this project pursuant to 9 VAC 25-210-10 et seq. In addition, because it is likely to disturb one acre or more of land area, the project will require a Virginia Pollutant Discharge Elimination System (VPDES) Stormwater General Permit for Construction Activities. Depending on the timing of various phases of the project, it is likely that multiple permits will be required. For questions relating to either of these permit programs, the project proponents should contact DEQ's Water Division (Ellen Gilinsky, telephone (804) 698-4375) or its Northern Virginia Regional Office (John Bowden, telephone (703) 583-3880).

2. Subaqueous Lands. The Marine Resources Commission has permit jurisdiction over any encroachments in, on, or over any state-owned rivers, streams, or creeks. If any portion of the project involves any encroachments channelward of ordinary high water along natural rivers and streams, a permit may be required from the Commission.

This permit, along with the Virginia Water Protection Permit, is included in the Joint Federal-State Permit Application (JPA) process by which permit applicants may apply for Corps of Engineers, DEQ, and Marine Resources Commission water resources permits with one application document. JPA forms and instructions are available from the Marine Resources Commission, and the JPA should be submitted to the Commission to initiate permit processing. Questions on Marine Resources Commission permits, or on the JPA process, may be addressed to the Commission (Tony Watkinson, telephone (757) 247-2200).

3. Erosion and Sediment Control; Stormwater Management. The Department of Conservation and Recreation encourages the proponents to contact DCR's Potomac Watershed Office in Warrenton (telephone (540) 347-6420) to obtain plan development or implementation assistance so as to ensure project compliance during and after construction. In addition, the Northern Virginia Regional Commission offers a *Guidebook for Maintaining BMPs in Northern Virginia* from the Commission's website (www.novaregion.org) or in paper, without charge (James Van Zee, telephone (703) 642-0700).

4. Solid and Hazardous Waste Management. DEQ's Waste Division reiterates its guidance, given in response to the Draft EIS, concerning contaminated soils, lead-based paints, and asbestos removal (see our reply to the Draft EIS, dated August 27, 2002 (DEQ-02-124F), page 10, item 1). That guidance follows.

Soil suspected of contamination, and wastes that are generated, must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations, including but not limited to the Virginia Waste Management Act (*Virginia Code* sections 10.1-1400 et seq.), the Virginia Hazardous Waste Management Regulations (9 VAC 20-60 et seq.), and the Virginia Solid Waste Management Regulations (9 VAC 20-80 et seq.). (See the attached DEQ memo, Modena to Ellis, dated December 1, 2003 for additional citations.)

If the structures to be demolished as part of this project have not yet been checked for the presence of asbestos-containing materials or lead-based paint, the following guidance pertains in the event either of these substances is found.

(a) Asbestos Abatement. If asbestos-containing materials (ACM) are found, following their classification as friable or non-friable, all waste ACM shall be disposed of in accordance with the Virginia Solid Waste Management Regulations (9 VAC 20-80-640), and transported in accordance with the Virginia regulations governing Transportation of Hazardous Materials (9 VAC 20-110-10 et seq.). The project manager should contact the DEQ Waste Management Program (telephone (804) 698-4021) and the Department of Labor and Industry, Dr. Clarence Wheeling, telephone (804) 786-0574 for additional information.

(b) Lead-Based Paint. The project must comply with the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) regulations, and with the Virginia Lead-Based Paint Activities Rules and Regulations. For additional information regarding these requirements, the project manager should contact the Department of Professional and Occupational Regulation (Thomas Perry, telephone (804) 367-8595).

5. Historic Resources Coordination. To ensure proper coordination pursuant to Section 106 of the National Historic Preservation Act, the proponents should maintain contact with the Department of Historic Resources (Marc Holma, telephone (804) 367-2323, extension 112).

As mentioned above, Loudoun County (Marie Genovese, Planning Department, telephone (703) 777-0246) should be regarded as a consulting party for purposes of mitigation of impacts on cultural resources. The County requests that a copy of the Programmatic Agreement (see "Environmental Impacts and Mitigation," item 6, above) be sent to its Planning Department (Attn: Marie Genovese, 1 Harrison Street, S.E., 3rd Floor, P.O. Box 7000, Leesburg, 20177).

6. Loudoun County. Planning and environmental questions relative to Loudoun County (see "Environmental Impacts and Mitigation," items 3, 6, and 9(b), above) may be addressed to the Loudoun County Planning Department (Marie Genovese, telephone (703) 777-0246).

7. Federal Consistency under the Coastal Zone Management Act. Pursuant to the Coastal Zone Management Act of 1972, as amended, the applicant agency for federal licensing or permitting is required to certify the consistency of its activities affecting Virginia's coastal resources or coastal uses with the Virginia Coastal Resources Management Program (VCP) (see section 307(c)(1) of the Act and the Federal Consistency Regulations at 15 CFR Part 930, sub-part D, section 930.57). This involves an analysis of the activities in light of the Enforceable Policies of the VCP (first enclosure), and submission of a consistency certification reflecting that analysis and committing the applicant agency to comply with the Enforceable Policies. DEQ also recommends careful consideration of the Advisory Policies of the VCP (second enclosure). The federal consistency certification may be provided as part of the documentation concluding the NEPA process (in this case the Final EIS), or independently, depending on the proponent agencies' preference. Section 930.58 gives content requirements for the consistency certification. If you need clarification of these comments, please contact Charles Ellis of this Office at (804) 698-4488.

Thank you for the opportunity to review the SDEIS for this project.

Sincerely,

Ellie L. Irons
Program Manager

Attachment 1

Enforceable Regulatory Programs comprising Virginia's Coastal Resources Management Program (VCP)

a. Fisheries Management - The program stresses the conservation and enhancement of finfish and shellfish resources and the promotion of commercial and recreational fisheries to maximize food production and recreational opportunities. This program is administered by the Marine Resources Commission (VMRC); Virginia Code §28.2-200 to §28.2-713 and the Department of Game and Inland Fisheries (DGIF); Virginia Code §29.1-100 to §29.1-570.

The State Tributyltin (TBT) Regulatory Program has been added to the Fisheries Management program. The General Assembly amended the Virginia Pesticide Use and Application Act as it related to the possession, sale, or use of marine antifoulant paints containing TBT. The use of TBT in boat paint constitutes a serious threat to important marine animal species. The TBT program monitors boating activities and boat painting activities to ensure compliance with TBT regulations promulgated pursuant to the amendment. The VMRC, DGIF, and Virginia Department of Agriculture Consumer Services (VDACS) share enforcement responsibilities; Virginia Code §3.1-249.59 to §3.1-249.62.

b. Subaqueous Lands Management - The management program for subaqueous lands establishes conditions for granting or denying permits to use state-owned bottomlands based on considerations of potential effects on marine and fisheries resources, tidal wetlands, adjacent or nearby properties, anticipated public and private benefits, and water quality standards established by the Department of Environmental Quality (DEQ). The program is administered by the Marine Resources Commission; Virginia Code §28.2-1200 to §28.2-1213.

c. Wetlands Management - The purpose of the wetlands management program is to preserve wetlands, prevent their despoliation, and accommodate economic development in a manner consistent with wetlands preservation.

(1) The tidal wetlands program is administered by the Marine Resources Commission; Virginia Code §28.2-1301 through §28.2-1320.

(2) The Virginia Water Protection Permit program administered by DEQ includes protection of wetlands --both tidal and non-tidal; Virginia Code §62.1-44.15:5 and Water Quality Certification pursuant to Section 401 of the Clean Water Act.

d. Dunes Management - Dune protection is carried out pursuant to The Coastal Primary Sand Dune Protection Act and is intended to prevent destruction or alteration of primary dunes. This program is administered by the Marine Resources Commission; Virginia Code §28.2-1400 through §28.2-1420.

e. Non-point Source Pollution Control – (1) Virginia's Erosion and Sediment Control Law requires soil-disturbing projects to be designed to reduce soil erosion and to decrease inputs of chemical nutrients and sediments to the Chesapeake Bay, its tributaries, and other rivers and waters of the Commonwealth. This program is administered by the Department of Conservation and Recreation; Virginia Code §10.1-560 et.seq.).

(2) Coastal Lands Management is a state-local cooperative program administered by the Chesapeake Bay Local Assistance Department and 84 localities in Tidewater (see i) Virginia; Virginia Code §10.1-2100 –10.1-2114 and 9 VAC10-20 et seq.

f. Point Source Pollution Control - The point source program is administered by the State Water Control Board (DEQ) pursuant to Virginia Code §62.1-44.15. Point source pollution control is accomplished through the implementation of:

(1) the National Pollutant Discharge Elimination System (NPDES) permit program established pursuant to Section 402 of the federal Clean Water Act and administered in Virginia as the Virginia Pollutant Discharge Elimination System (VPDES) permit program.

(2) The Virginia Water Protection Permit (VWPP) program administered by DEQ; Virginia Code §62.1-44.15:5 and Water Quality Certification pursuant to Section 401 of the Clean Water Act.

g. Shoreline Sanitation - The purpose of this program is to regulate the installation of septic tanks, set standards concerning soil types suitable for septic tanks, and specify minimum distances that tanks must be placed away from streams, rivers, and other waters of the Commonwealth. This program is administered by the Department of Health (Virginia Code §32.1-164 through §32.1-165).

h. Air Pollution Control - The program implements the federal Clean Air Act to provide a legally enforceable State Implementation Plan for the attainment and maintenance of the National Ambient Air Quality Standards. This program is administered by the State Air Pollution Control Board (Virginia Code §10-1.1300 through §10.1-1320).

(i) Coastal Lands Management is a state-local cooperative program administered by the Chesapeake Bay Local Assistance Department and 84 localities in Tidewater, Virginia established pursuant to the Chesapeake Bay Preservation Act; Virginia Code §10.1-2100 –10.1-2114 and Chesapeake Bay Preservation Area Designation and Management Regulations; Virginia Administrative Code 9 VAC10-20 et seq.

Attachment 2

Advisory Policies for Geographic Areas of Particular Concern

a. Coastal Natural Resource Areas - These areas are vital to estuarine and marine ecosystems and/or are of great importance to areas immediately inland of the shoreline. Such areas receive special attention from the Commonwealth because of their conservation, recreational, ecological, and aesthetic values. These areas are worthy of special consideration in any planning or resources management process and include the following resources:

a) Wetlands
b) Aquatic Spawning, Nursery, and Feeding Grounds
c) Coastal Primary Sand Dunes
d) Barrier Islands
e) Significant Wildlife Habitat Areas
f) Public Recreation Areas
g) Sand and Gravel Resources
h) Underwater Historic Sites.

b. Coastal Natural Hazard Areas - This policy covers areas vulnerable to continuing and severe erosion and areas susceptible to potential damage from wind, tidal, and storm related events including flooding. New buildings and other structures should be designed and sited to minimize the potential for property damage due to storms or shoreline erosion. The areas of concern are as follows:

i) Highly Erodible Areas
ii) Coastal High Hazard Areas, including flood plains.

c. Waterfront Development Areas - These areas are vital to the Commonwealth because of the limited number of areas suitable for waterfront activities. The areas of concern are as follows:

i) Commercial Ports
ii) Commercial Fishing Piers
iii) Community Waterfronts

Although the management of such areas is the responsibility of local government and some regional authorities, designation of these areas as Waterfront Development Areas of Particular Concern (APC) under the VCRMP is encouraged. Designation will allow the use of federal CZMA funds to be used to assist planning for such areas and the implementation of such plans. The VCRMP recognizes two broad classes of priority uses for waterfront development APC:

i) water access dependent activities;
ii) activities significantly enhanced by the waterfront location and complementary to other existing and/or planned activities in a given waterfront area.

Attachment 2 con't

Advisory Policies for Shorefront Access Planning and Protection

a. Virginia Public Beaches - Approximately 25 miles of public beaches are located in the cities, counties, and towns of Virginia exclusive of public beaches on state and federal land. These public shoreline areas will be maintained to allow public access to recreational resources.

b. Virginia Outdoors Plan - Planning for coastal access is provided by the Department of Conservation and Recreation in cooperation with other state and local government agencies. The Virginia Outdoors Plan (VOP), which is published by the Department, identifies recreational facilities in the Commonwealth that provide recreational access. The VOP also serves to identify future needs of the Commonwealth in relation to the provision of recreational opportunities and shoreline access. Prior to initiating any project, consideration should be given to the proximity of the project site to recreational resources identified in the VOP.

c. Parks, Natural Areas, and Wildlife Management Areas - Parks, Wildlife Management Areas, and Natural Areas are provided for the recreational pleasure of the citizens of the Commonwealth and the nation by local, state, and federal agencies. The recreational values of these areas should be protected and maintained.

d. Waterfront Recreational Land Acquisition - It is the policy of the Commonwealth to protect areas, properties, lands, or any estate or interest therein, of scenic beauty, recreational utility, historical interest, or unusual features which may be acquired, preserved, and maintained for the citizens of the Commonwealth.

e. Waterfront Recreational Facilities - This policy applies to the provision of boat ramps, public landings, and bridges which provide water access to the citizens of the Commonwealth. These facilities shall be designed, constructed, and maintained to provide points of water access when and where practicable.

f. Waterfront Historic Properties - The Commonwealth has a long history of settlement and development, and much of that history has involved both shorelines and near-shore areas. The protection and preservation of historic shorefront properties is primarily the responsibility of the Department of Historic Resources. Buildings, structures, and sites of historical, architectural, and/or archaeological interest are significant resources for the citizens of the Commonwealth. It is the policy of the Commonwealth and the VCRMP to enhance the protection of buildings, structures, and sites of historical, architectural, and archaeological significance from damage or destruction when practicable.

If you cannot meet the deadline, please notify CHARLIE ELLIS at 804/698-4488 prior to the date given. Arrangements will be made to extend the date for your review if possible. An agency will not be considered to have reviewed a document if no comments are received (or contact is made) within the period specified.

REVIEW INSTRUCTIONS:

A. Please review the document carefully. If the proposal has been reviewed earlier (i.e. if the document is a federal Final EIS or a state supplement), please consider whether your earlier comments have been adequately addressed.

B. Prepare your agency's comments in a form which would be acceptable for responding directly to a project proponent agency.

C. Use your agency stationery or the space below for your comments. **IF YOU USE THE SPACE BELOW, THE FORM MUST BE SIGNED AND DATED.**

Please return your comments to:

MEMORANDUM

Date: 25 November 2003

To: Charles H. Ellis, III, Virginia Department of Environmental Quality

Derral Jones

From: Derral Jones, Planning Bureau Manager

Subject: DEQ#03-210F: Dulles Corridor Rapid Transit Project, Alternative and Construction Phasing

The Department of Conservation and Recreation (DCR) functions to preserve and protect the environment of the Commonwealth of Virginia and advocate the wise use of its scenic, cultural, recreation and natural heritage resources. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, state unique or exemplary natural communities, significant geologic formations and similar features of scientific interest.

DCR has searched its Biotics Data System for occurrences of natural heritage resources from the area outlined on the submitted maps. According to the information currently in our files, natural heritage resources have been documented in the project area. However, due to the scope of the activity and the distance to the resources, we do not anticipate that this project will adversely impact these natural heritage resources.

In addition, no State Natural Areas under DCR's jurisdiction are in the project vicinity

Under a Memorandum of Agreement between the Virginia Department of Agriculture and Consumer Services (VDACS) and the Virginia Department of Conservation and Recreation, DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plants and insects. The current activity will not affect any documented state-listed plants or insects.

Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks other natural heritage resources. New and updated information is continually added to Biotics. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

Please note that federal agencies and their authorized agents conducting regulated land disturbing activities on private and public lands in the state must comply with the Virginia Erosion and Sediment Control Law and Regulations (VESCL&R), Virginia Stormwater Management Law and Regulations (VSWML&R), and other applicable federal non-point source pollution mandates (e.g., Clean Water Act-Section 313, Federal Consistency under the Coastal Zone Management Act). Clearing and grading activities, installation of staging areas, parking lots, roads, buildings, utilities, or other structures, soil/dredge spoil areas, or related land conversion activities that disturb 2,500 square feet or more would be regulated by VESCL&R and those that disturb one acre or greater would be covered by VSWML&R. Accordingly, federal agencies should prepare and implement erosion and sediment control (ESC) and stormwater management (SWM) plans to ensure compliance with state law. The sponsoring federal agency is ultimately responsible for achieving project compliance through oversight of on site contractors, regular field inspection, prompt action against non-compliant sites, and/or other mechanisms consistent with agency policy. We highly encourage the sponsoring agency to contact DCR's Potomac Watershed Office (540-347-6420) to obtain plan development or implementation assistance to ensure project conformance during and after active construction. *[Reference: VESCL §10.1-567; VSWML §10.1-603.15]*

Regarding recreation facilities, this study does a thorough job of addressing the crossing impacts on the W & OD trail. We encourage continued consultation with the Northern Virginia Regional Park Authority regarding the W&OD trail. Please note that there is a future greenway/trail in the area that is not addressed in the document. As presented, the corridor will cross the proposed Fairfax Cross Country Trail which will connect the Great Falls National Park with Ft. Belvoir. Consideration and accommodation for this trail should be addressed in the final plans. We recommend coordination with the local trail and greenways representatives and the Fairfax County Park Authority.

Thank you for the opportunity to offer comments on this project.

MEMORANDUM

TO: Charles Ellis

FROM: Thomas Modena TDM

DATE: December 1, 2003

COPIES: Kevin Greene

SUBJECT: Revised Supplemental Draft Environmental Impact Statement
Dulles Corridor Rapid Transit Project

The Waste Division has reviewed the Revised Draft Environmental Impact Statement for the Federal Transit Administration's Dulles Corridor Rapid Transit Project. We have the following comments concerning the waste issues associated with this project.

Solid and hazardous waste issues and sites were addressed in the report. The central office of the Waste Division did a cursory review of its data files and did not find any additional sites that might impact this project.

Any soil that is suspected of contamination or wastes that are generated must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations. Some of the applicable state laws and regulations are: Virginia Waste Management Act, Code of Virginia Section 10.1-1400 *et seq.*; Virginia Hazardous Waste Management Regulations (VHWMR) (9VAC 20-60); Virginia Solid Waste Management Regulations (VSWMR) (9VAC 20-80); Virginia Regulations for the Transportation of Hazardous Materials (9VAC 20-110). Some of the applicable Federal laws and regulations are: the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Section 6901 *et seq.*, and the applicable regulations contained in Title 40 of the Code of Federal Regulations; and the U.S. Department of Transportation Rules for Transportation of Hazardous Materials, 49 CFR Parts 107, 171.1-172.558.

The report states that structures that will be demolished would be checked for the presence of asbestos-containing materials (ACM) or lead-based paint (LBP). If LBP or ACM

are found, in addition to the Federal waste-related regulations, State regulations 9VAC 20-80-640 for ACM and 9VAC 20-60-261 for LBP must be followed.

Finally, pollution prevention was not addressed in the report. VDEQ encourages all construction projects and facilities to implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated.

If you have any questions or need further information, please let me know.

Memorandum

VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY
WATER DIVISION
Larry G. Lawson, P.E., Director

To: Charles H. Ellis III
Environmental Program Planner

From: Ellen Gilinsky, Ph.D., PWS
VWP Permit Program Manager

Date: November 17, 2003

RECEIVED
NOV 17 2003
DEQ-Div. of Environmental Enhancement

Subject: Dulles Corridor Rapid Transit Project
USDOT/Federal Transit Administration/VDRPT/WMATA/FAA
Project Number 03-210F

On behalf of the DEQ-Water Division, we have reviewed the Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation regarding the proposed roadway improvement project in Fairfax and Loudoun Counties, Virginia. Site activities will include the extension of mass transit service through the Dulles corridor. Specifically, the Locally Preferred Alternative (LPA) includes extension of existing regional Metrorail system in Fairfax County and into eastern Loudoun County, including Tysons Corner and Washington Dulles International Airport.

The report states that the new rail lines will be primarily within the medians of the existing roads. We commend this surface water avoidance and impact minimization strategy. The full LPA is projected to impact up to 4.9 acres of wetlands and 245 linear feet of streams. Phase I has significantly less impacts to surface waters. A VWP Permit may be required. The project proponent should prepare and submit a Joint Permit Application to the VMRC for review and coordination by federal and state agencies. Please coordinate with the DEQ Central Office for final permit determination. Please continue to explore ways to further avoid and minimize impacts to surface waters as you enter the design phase of your project. Examples of avoidance and minimization efforts include completely spanning wetlands and streams to avoid impact and shifting the alignment to avoid or minimize surface water impacts. The selected alternative's unavoidable impacts to wetlands and streams will require full compensatory mitigation as explained in the report, including permanent conversion from one wetland type to another of lesser value. We recommend strict adherence to erosion and stormwater management practices and further encourage the project proponent to monitor construction activities to make certain that erosion and stormwater management practices are adequately preventing sediment and pollutant migration into adjacent surface waters. Provided all applicable permits are obtained, the project should be consistent with the VWP Program.

Ellis,Charles

From: Bowden,John
Sent: Tuesday, December 02, 2003 7:59 AM
To: Ellis,Charles
Subject: EIS #03-210F

NVROs comments regarding the EIS for the Dulles Corridor Rapid Transit Project submitted by USDOT/Federal Transit Administration are as follows:

1.The Dulles Corridor Rapid Transit project as presented proposes to impact 4.9 acres of wetlands and 245 linear feet of stream channel. The proposed impacts will require a permit in accordance with the 9 VAC 25-210-10 et seq. Virginia Water Protection Permit Program Regulation. Compensatory mitigation for all impacts to state waters will require review and approval by DEQ in accordance with 9 VAC 25-210-10 et seq. Virginia Water Protection Permit Program Regulation.

2. The report looks good with regard to water quality impacts. Do not see any mention of permitting for stormwater discharges or discussion of mitigation of stormwater from the rail lines once they are constructed an operating. Do they anticipate using oil/water separators where the cars are stored?

3. The project(s) as described will involve land disturbance / construction activities on large areas of land, primarily within the medians of the Dulles Connector Road, DIAAH, and Dulles Greenway. VPDES permit coverage for stormwater discharges associated with construction activity will be required. Depending on the timing and implementation of the various phases of the plan, it is likely that multiple permits will be needed. Land disturbance activities in excess of one acre require VPDES permit coverage for stormwater discharges. Conformance with state and local sediment and erosion control and stormwater management programs should minimize short term impacts to water quality.

4. The plan to construct the subject project, as described, appears to have adequately addressed potential air pollution impacts. It should be noted that this document references an earlier draft EIS with regard to the substantial details, but the general text provided satisfies the substantial requirements for fugitive dust control (the main issue from an air standpoint).

Re: Dulles Corridor Rapid Transit Project
Supplemental Draft Environmental Impact Statement (EIS)
Fairfax and Loudoun Counties
DHR File # 2000-1061

Dear Mr. Rohrer:

We have received your request for our review and comment on the Environmental Impact Statement (EIS) regarding the above referenced project. The document attempts to address the environmental affects that the proposed construction of the 23-mile high-capacity transit line will have to include those on historic properties. Please accept the following comments as our response to the current EIS.

The subject document attempts to address "the potential long-term and construction effects" of the Dulles Corridor Rapid Transit Project for the Local Preferred Alternative (LPA). The EIS evaluates the effects of the project on two archaeological sites (44FX2662 and 44FX2405) and an historic district (Hunter Mill Road Historic District) newly added for consideration since the last draft EIS. Additionally, the current EIS re-considers effects on the Washington Dulles International Airport, a property eligible for listing in the National Register of Historic Resources, and a House located at 22017 Shellhorn Road in Ryan.

The revised EIS asserts that there would be no adverse effect to architectural resources as a result of the LPA. We cannot concur with this statement. The project corridor crosses the boundary of the Hunter Mill Road Historic District. Despite the claim that "because the Hunter Mill Road Historic District is located within an existing transportation corridor, impacts to the district associated with this project would be minimal," you have not provided the Department of Historic Resources (DHR) sufficient information in order for us to agree with this statement. Similarly, the report cites "further analysis" confirming that the proposed LPA would not cause an adverse visual effect on the "peekaboo" sequence along the approach to Dulles Airport. We have not had the opportunity to review and comment on the aforementioned analysis. Therefore, we cannot agree that your assertion is correct. In fact, the issue of an appropriate National Register boundary for the airport is still an outstanding issue that must be settled before the discussion of effect can happen.

Re: Dulles Corridor Rapid Transit Project Draft EIS

Dear Mr. Rohrer:

The Northern Virginia Regional Commission staff has reviewed the document described above and has the following comments.

Please be advised that Fairfax County and the Town of Herndon have enacted jurisdiction-wide Chesapeake Bay Resource Management Area (RMA) designation. This RMA designation requires that all development result in a no-net-increase standard for phosphorus loadings, based on the jurisdiction's average imperviousness.

Special attention should be given to post-construction stormwater quality management. The developing agency must adhere to the post-development water quality requirements set forth by the Virginia Stormwater Management Regulations (VR 215-02-00 Part IV and §2.3). Meeting the Virginia Stormwater Management Regulations should comply with the requirement that state agencies meet the local ordinances pursuant to the Virginia Chesapeake Bay Act.

Please refer to the *Northern Virginia BMP Handbook* for calculation procedures. A copy of the handbook is available on NVRC's website, www.novaregion.org.

We would also suggest that, where possible, opportunities for retrofit of existing stormwater quantity facilities to stormwater quality facilities through new construction activities should be explored. NVRC's *Guidebook for Maintaining BMPs in Northern Virginia* is available, without charge, should you need it, and can also be downloaded from our website, or call me if you would like to receive a copy to use as a reference.

A copy of this letter should be included with your submission to indicate that the review by this agency has been completed.

Your cooperation in the intergovernmental review process is appreciated.

Sincerely yours,

James Van Zee
Director, Regional Planning Services

If you cannot meet the deadline, please notify CHARLIE ELLIS at 804/698-4488 prior to the date given. Arrangements will be made to extend the date for your review if possible. An agency will not be considered to have reviewed a document if no comments are received (or contact is made) within the period specified.

REVIEW INSTRUCTIONS:

A. Please review the document carefully. If the proposal has been reviewed earlier (i.e. if the document is a federal Final EIS or a state supplement), please consider whether your earlier comments have been adequately addressed.

B. Prepare your agency's comments in a form which would be acceptable for responding directly to a project proponent agency.

C. Use your agency stationery or the space below for your comments. **IF YOU USE THE SPACE BELOW, THE FORM MUST BE SIGNED AND DATED.**

Please return your comments to:

Re: Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation, Dulles Corridor Rapid Transit Project (Hearing No. 160, Docket R03-6)

Dear Mr. Ellis,

Thank you for the opportunity to comment on the above referenced project. The Revised Countywide Transportation Plan (CTP), adopted on July 23, 2001, identifies the Dulles Corridor Rapid Transit Project as one of the County's and Region's priority transportation projects (CTP, text, p. 2-3). Additionally, the County's Revised General Plan policies encourage transit-supportive development at planned transit nodes (Revised General Plan, pp. 6-22 to 6-27).

The County' s Bicycle and Pedestrian Mobility Master Plan (Bike/Ped Plan) was adopted on October 20, 2003. Please note that this document outlines policies establishing the need for high quality bicycle and pedestrian access to the future transit stations (Bike/Ped Plan, Transit and Demand Management Policies, p. 35). The County wishes to ensure that well designed bicycle and pedestrian access will be provided through the transit stations providing access to development on both sides of the Greenway. The County wishes to be a consulting party as the design program is further developed.

I have outlined by section and topic my comments below:

Section 1.3 Planning Context: Paragraph 2 notes the Countywide Transportation Plan this should be changed to the Revised Countywide Transportation Plan (2001).

Section 1.3 Planning Context: It should be noted that the Revised General Plan allows for up to 50 dwelling units per acre when rail transit and facilities are planned, scheduled, designed and fully funded to serve the area designated as a Transit-Oriented Development (TOD) (Revised General Plan, Policy 12c, p. 6-25). The TOD is located between the Loudoun County Parkway and Route 772 interchanges (Revised General Plan, text, p. 6-22). The transit node proposed for the Route 606 station is planned for a Transit-Related Employment Center (TREC), planned for concentrated employment use or Special Activity destination

(Revised General Plan, text, p. 6-22). Residential development is not permitted within the TREC due to the constraints of the Dulles Airport 65 Ldn, the Dulles North Transit Center, and the importance of preserving the natural environment (Revised General Plan, text, p. 6-22).

Section 1.3 Planning Context: The last sentence on page 1-7 should be edited to read "The *Loudoun County Revised Countywide Transportation Plan* also includes public support for transit services that would use the corridor, such as carpools, vanpools, bus and rail services, and other alternative modes, with specific funding support for bus services".

Section 2.2.4: Comparative Evaluation of Alternatives: County staff questions the evaluation of alternatives using a 2025 forecast horizon year. Results for the full LPA should use a broader forecast horizon year given that the full build LPA would be in operation by 2015. County staff does not feel that a 10 year forecast horizon provides an adequate description.

Section 3.1 Land Use: The total amount of development for Moorefield Station in this section is incorrect. Moorefield Station was approved for 10,750,000 square feet of non-residential development and 6,750 residential units.

Section 3.1.1.2.B. Proposed LPA Phase I: It should be noted that the Revised General Plan also supports the extension of rail facilities to the Dulles Airport (Revised General Plan, text, p. 4-8). Therefore, the proposed LPA Phase 1 is not consistent with the Revised General Plan because it would not provide rapid transit to Dulles International Airport and the Route 606 and Route 772 station areas.

Section 3.2.1.2.B. Proposed LPA Phase I: County staff asks that the first sentence on page 3-20 be clarified. "If the proposed LPA were not constructed in its entirety by 2025, neighborhoods located west of the Wiehle Avenue station area would not receive mobility benefits from access to Metrorail service during the proposed LPA Phase 1." Metrorail service is not planned to extend west of Wiehle Avenue as part of proposed LPA Phase 1.

Section 3.4 Visual and Aesthetic Conditions: This section states that a site plan has been approved for the Moorefield Station development. This statement is incorrect, the rezoning has been approved for Moorefield Station however, no site plans have been approved at this time.

Section 3.5 Cultural Resources: The County should continue to be a consulting party as impact mitigation strategies are discussed. Additionally, the Area of Potential Effect (APE) was defined as 200 feet beyond station footprints to allow for possible variation during construction. The County should be contacted if variations to the proposed alignment will impact additional sites.

Please forward a copy of the Programmatic Agreement from the State Historic Preservation Officer (SHPO) to:

Loudoun County Planning Department
c/o Marie Genovese
1 Harrison St., S.E., 3rd Floor
P.O. Box 7000
Leesburg, VA 20177-7000

Section 3.6.3 Mitigation: The document states that temporary construction impacts at the Moorefield Station recreation center and athletic fields will be mitigated, but does not provide any information as to how impacts will be mitigated.

Section 4.1.1.2A Proposed Full LPA: The total amount of development for Moorefield Station in this section is incorrect. Moorefield Station was approved for 10,750,000 square feet of non-residential development and 6,750 residential units.

Section 4.2 Water Resources: The County's Revised 1993 Zoning Ordinance was adopted on January 6, 2003 implementing many of the policies outlined in the Revised General Plan. The River and Stream Corridor Overlay District (RSCOD) was established with the revisions to the Zoning Ordinance (Section 4-2000). River and Stream Corridor Resources include:

a. "Rivers and streams draining 100 acres or more.
b. 100-year floodplains (including major and minor).
c. Adjacent steep slopes (slope 25 percent or greater, starting within 50 feet of streams and floodplains, extending no farther than 100 feet beyond the originating stream or floodplain).
d. 50-foot Management Buffer surrounding the floodplains and adjacent steep slopes.
e. Wetlands, forests, historic and cultural resources, and archaeological sites that fall within the area of one or more of the above elements" (Revised General Plan, Policy 2, p. 5-6).

Additionally, a 300-foot no-build buffer or the RSCOD, whichever is greater will be applied to scenic rivers, the Potomac River, the Bull Run, and the protected shoreline of drinking water reservoirs (Revised General Plan, Policies 1, 8, & 11, pp. 5-11 & 5-17). Please ensure that all the elements of the RSCOD have been taken into account when determining impacts to water resources.

Section 4.2.3 Mitigation: Coordination with local jurisdictions regarding mitigation for the nonconformity of any project elements within critical areas is listed as an available option. County staff considers this to be a requirement for any element of the project that impacts the RSCOD.

Section 4.2.3 Mitigation: The County supports the federal goal of no net loss to wetlands and will identify optimum receiving sites with a priority given to each geographic Policy Area (Revised General Plan, Policy 23, p. 5-8). Therefore, the County prefers any wetland impacts incurred in Loudoun County from the proposed project be mitigated within the Suburban Policy Area. However, if a wetland mitigation bank is not available within the Suburban Policy Area at the time the impacts are incurred County staff prefers that impacts to wetlands within Loudoun County be mitigated at the Bull Run Wetland Bank as shown on Figure 4.2-2.

Section 9.2.1.2B. Proposed LPA Phase 1: This section states that changes in land use under the proposed LPA and proposed LPA Phase 1 would be most dramatic in Loudoun County, where land use that is currently rural in nature would be converted to mixed-use suburban centers. It should be noted that the proposed alignment for the Dulles Corridor Rapid Transit Project is located in the

Suburban Policy Area as defined by the Revised General Plan and is planned for suburban-scale residential and non-residential development (Revised General Plan, Chapter 6).

County staff anticipates the Board of Supervisors to adopt a Resolution regarding the proposed project on December 15, 2003, at which time it will be forwarded to the Department of Rail and Public Transportation to be added to the public record.

If you have any questions regarding these comments please contact Marie Genovese, Planner in the Department of Planning at (703) 777-0246.

Sincerely,

Kirby M. Bowers

Mr. Corey W. Hill,

Thank you for addressing our comments regarding water quality and water permitting issues including impacts to wetlands and streams. We appreciate your thorough consideration of our comments. Please continue to investigate ways to reduce the project's impact on state waters. Please contact us with any questions and information on the development of your project.

RE: Draft Environmental Impact Statement and Section 4(f) Evaluation,
Dulles Corridor Rapid Transit Project
DEQ-02-124F

Dear Mr. Hill:

The Commonwealth of Virginia has completed its review of the Draft Environmental Impact Statement (Draft EIS) described above. The Department of Environmental Quality is responsible for coordinating Virginia's review of federal environmental documents and responding to appropriate federal officials on behalf of the Commonwealth. The following agencies took part in this review:

Department of Environmental Quality
Department of Conservation and Recreation
Department of Transportation
Marine Resources Commission
Department of Historic Resources
Department of Mines, Minerals, and Energy
Department of Forestry
Chesapeake Bay Local Assistance Department.

In addition, the Department of Game and Inland Fisheries, Virginia Economic Development Partnership, the Northern Virginia Regional Commission, and Fairfax and Loudoun Counties were invited to comment.

Project Description

According to the Draft EIS, the Federal Transit Administration and the Washington Metropolitan Area Transit Authority, in cooperation with the Federal Aviation Administration, are joining the Department of Rail and Public Transportation in proposing alternative transit improvements in the Dulles Corridor. This corridor runs from the East Falls Church Metrorail station in Fairfax County past Tysons Corner to Dulles Airport and into Loudoun County. (Page S-1).

The "baseline" or "no-build" alternative consists of existing highway and transit infrastructure and services, and any that are committed for implementation by the year 2025 (Draft EIS, page 2-4, section 2.2). The four "build" alternatives are:

- "BRT" (bus rapid transit) Alternative: Buses, operated more like trains (separate stations, off-board ticketing, etc.) would connect the West Falls Church Metrorail station with Route 772 and the Dulles Greenway in Loudoun County, west of the Airport. The Draft EIS presents three alignment options. (Pages 2-14 through 2.19 and Figures 2.3-1a and 2.3-1b, section 2.3).

- Metrorail Alternative: The Metrorail system would be extended from a point between the East and West Falls Church stations to Route 772, by way of a number of track and station alignment options, and ancillary facilities would be included (Draft EIS, pages 2-32 through 2-58, section 2.3.2).

- BRT-Metrorail Alternative: The Metrorail system would be extended from a point between the East and West Falls Church stations to Tysons Corner, after which the bus rapid transit would operate to Route 772. Again, different alignments would be considered (Draft EIS, page 2-58, section 2.3.3.).

- Phased Implementation Alternative: Metrorail would be phased in throughout the corridor (West Falls Church metro station to Route 772) by first extending bus rapid transit, then replacing it with Metro to Tysons Corner and later replacing it to Route 772 (Draft EIS, page 2-14, section 2.3).

Environmental Impacts and Mitigation

The Commonwealth of Virginia has no objection to any of the "build" alternatives. It appears to us that any of the "build" alternatives would be preferable to the no-action alternative, given the widely acknowledged beneficial air quality impacts of improved mass transit, particularly in the Northern Virginia ozone non-attainment area.

1. Natural Heritage and Wildlife Resources. According to the Department of Conservation and Recreation (DCR), "natural heritage resources" are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geological formations. According to DCR files, several rare plants may occur in project locations if suitable habitat is present. These plants are typically associated with prairie vegetation and inhabit semi-open diabase glades in Virginia. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia and located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plant occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction.

In Northern Virginia, diabase supports occurrences of several globally rare and state rare plant species (see the "Definition of Abbreviations" on pages 2 and 3 of the attached August 1, 2002 comments from DCR). These include:

earleaf foxglove (*Agalinis auriculata*)
white heat aster (*Aster ericoides*)
blue-hearts (*Buchnera americana*)
hairy beardtongue (*Penstemon hirsutus*)
downy phlox (*Phlox pilosa*)
stiff goldenrod (*Oligoneuron rigidum* var. *rigidum*)
marsh hedgenettle (*Stachys pilosa* var. *arenicola*).

The earleaf foxglove is currently tracked as a species of concern by the U.S. Fish and Wildlife Service; however, this designation has no legal status, according to DCR.

Because the project corridor has the potential to support populations of these natural heritage resources, DCR recommends an inventory of suitable habitat in the study area. With the survey results, DCR can more accurately evaluate potential resource impacts and recommend specific protection measures to minimize the impacts. In this regard, the Department of Conservation and Recreation's Division of Natural Heritage employs biologists who are qualified and available to conduct inventories for rare, threatened, and endangered species. We recommend that the project manager (Department of Rail and Public Transportation, the Washington Metropolitan Area Transit Authority, or other project management agency) contact the Division of Natural Heritage (Christopher Ludwig, Natural Heritage Inventory Manager, telephone (804) 371-6206) to discuss arrangements for field survey work.

The Department of Conservation and Recreation has not surveyed any sites within the project area (see Draft EIS, pages 4-77 through 4-81, section 4.5.3), but recommends doing so before September ends if possible. The Draft EIS concludes that there is no suitable habitat for rare diabase plants (page 4-81); this conclusion should be re-evaluated during the appropriate season.

The Department of Agriculture and Consumer Services, which is responsible for protection of state-listed plant and insect species, indicates that it has nothing to add to the discussion of rare, threatened, and endangered species (Draft EIS, pages 4-76 through 4-81, section 4.5).

Under Title 29.1 of the Code of Virginia, the Department of Game and Inland Fisheries (DGIF) is the primary wildlife and freshwater fish management agency in the Commonwealth. DGIF has full law enforcement and regulatory jurisdiction over all wildlife resources, inclusive of state and federally endangered or threatened species, but excluding listed insects. The agency maintains a comprehensive system of databases of wildlife resources that is available through the Agency's site at www.dgif.state.va.us, in the "Wildlife" section from the link to "Wildlife Information Online". DGIF determines likely impacts on fish and wildlife resources and habitats, and recommends appropriate measures to avoid, reduce or compensate for those impacts. For more information on the Wildlife Information Online Service, the project manager may contact Kathy Quindlen at (804) 367-9717.

2. Solid and Hazardous Waste Management. DEQ's Division of Waste Program coordination, Office of Remedial Programs (hereinafter "DEQ's Waste Division") did a cursory review of its data files and did not find any contamination sites that might affect, or be affected, by this project. The Draft EIS addressed hazardous and solid waste issues (pages 4-170 through 4-184, section 4.9).

The Draft EIS indicates that structures to be demolished have not been checked for the presence of asbestos-containing materials or for lead-based paint, but it indicates a commitment on the part of the project manager to follow applicable rules in these regards (page 4-184, section 4.9.5). See "Regulatory and Coordination Needs," item 1, below for more information.

DEQ encourages the project manager to reduce solid waste at the source, re-use materials, and recycle wastes to the maximum extent practicable. The Draft EIS did not address pollution prevention, according to DEQ's Waste Division; see item 11, below.

3. Air Quality. According to DEQ's Division of Air Program Coordination (hereinafter "DEQ's Air Division"), the project is in an ozone non-attainment area, which means that the project managers should take all precautions to limit the emissions of

volatile organic compounds (VOCs) and oxides of nitrogen (NO_x). Detailed modeling studies have established that none of the alternatives under consideration will significantly affect air quality. It appears to us that any of the "build" alternatives would be preferable to the no-action alternative, given the widely acknowledged beneficial air quality impacts of improved mass transit, particularly in the Northern Virginia ozone non-attainment area.

An additional precaution in ozone non-attainment areas, stemming from 9 VAC 5-40-5490 in the Regulations for the Control and Abatement of Air Pollution, is that there are some limitations on the use of "cut-back" asphalt (liquefied asphalt cement, blended with petroleum solvents) that may apply in the construction of the roads or paths associated with the project. The asphalt must be "emulsified" (predominantly cement and water with a small amount of emulsifying agent) except when specified circumstances apply. Moreover, there are time-of-year restrictions on its use during the months of April through October in VOC emission control areas.

During construction activities, fugitive dust must be kept at a minimum by using control methods outlined in 9 VAC 5-50-60 et seq. of the Regulations. These precautions include, but are not limited to, the following:

- Use, where possible, of water or chemicals for dust control;
- Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials;
- Covering of open equipment for conveying materials; and
- Prompt removal of spilled or tracked dirt or other materials from paved streets and removal of dried sediments resulting from soil erosion.

In addition, if project activities include the burning of construction or demolition material, this activity must meet the requirements under 9 VAC 5-40-5600 et seq. of the Regulations for open burning, and a permit may be required. The Regulations provide for, but do not require, the local adoption of a model ordinance concerning open burning; we recommend that the project managers contact Fairfax and Loudoun County officials to determine what local requirements, if any, exist. Some applicable provisions of the model regulation include, but are not limited to:

- All reasonable effort shall be made to minimize the amount of material burned, with the number and size of the debris piles;
- The material to be burned shall consist of brush, stumps and similar debris waste and clean burning demolition material;
- The burning shall be at least 500 feet from any occupied building unless the occupants have given prior permission, other than a building located on the property on which the burning is conducted;

- The burning shall be conducted at the greatest distance practicable from highways and air fields;
- The burning shall be attended at all times and conducted to ensure the best possible combustion with a minimum of smoke being produced;
- The burning shall not be allowed to smolder beyond the minimum period of time necessary for the destruction of the materials; and
- The burning shall be conducted only when the prevailing winds are away from any city, town or built-up area.

Heating units associated with new stations or other structures may require new source review permits or operating permits from DEQ. See "Regulatory and Coordination Needs," item 2, below.

4. Historic Structures and Archaeological Resources. The Department of Historic Resources indicates that it is working with project management agencies and their consultant on the identification of historic properties in the proposed corridor. The agencies involved will sign a Programmatic Agreement with the Department of Historic Resources which outlines procedures for the identification and evaluation of historic properties and plans for mitigation of effects upon properties listed on or eligible for the National Register of Historic Places. We encourage the agencies involved to continue coordinating with the Department of Historic Resources as this project evolves.

5. Water and Wetlands. According to DEQ's Division of Water Program Coordination, Office of Water Permits Support (hereinafter "DEQ's Water Division"), any of the "build alternatives" would affect surface waters and wetlands. The limitation of proposed construction to the median of existing roads, as much as practicable, will be helpful in avoiding and minimizing wetland and waterway impacts of the project; we encourage additional efforts in this regard as the project progresses. Examples of avoidance and minimization efforts include completely spanning wetlands to avoid impacts, and shifting the alignment of road or rail structures. Unavoidable impacts to wetlands and streams may require compensatory mitigation, as the Draft EIS explains (pages 4-54 through 4-58, section 4.2.6).

In general, DEQ recommends that stream and wetland impacts be avoided to the maximum extent practicable. For unavoidable impacts, DEQ encourages the following practices to minimize the impacts to wetlands and waterways:

- Operate machinery and construction vehicles outside of stream-beds and wetlands; use synthetic mats when in-stream work is unavoidable;
- Erosion and sedimentation controls should be designed in accordance with the most current edition of the Virginia Erosion and Sediment Control Handbook.

These controls should be in place prior to clearing and grading, and maintained in good working order to minimize impacts to State waters. The controls should remain in place until the area is stabilized. (See item 6, below.)

- Place heavy equipment, located in temporarily impacted wetland areas, on mats, geotextile fabric, or use other suitable measures to minimize soil disturbance, to the maximum extent practicable.
- Restore all temporarily disturbed wetland areas to pre-construction conditions and plant or seed with appropriate wetlands vegetation in accordance with the cover type (emergent, scrub-shrub, or forested). The project managers should take all appropriate measures to promote re-vegetation of these areas. Stabilization and restoration efforts should occur immediately after the temporary disturbance of each wetland area instead of waiting until the entire project has been completed.
- Place all materials which are temporarily stockpiled in wetlands, designated for use for the immediate stabilization of wetlands, on mats or geotextile fabric in order to prevent entry into State waters. These materials should be managed in a manner that prevents leachates from entering state waters and must be entirely removed within thirty days following completion of that construction activity. The disturbed areas should be returned to their original contours, stabilized within thirty days following removal of the stockpile, and restored to the original vegetated state.

The project may require a Virginia Water Protection Permit, and it is likely to require a Virginia Pollutant Discharge Elimination System (VPDES) Stormwater permit. See "Regulatory and Coordination Needs, item 3, below.

6. Erosion and Sediment Control; Stormwater Management. Executive Order 12088, "Federal Compliance with Pollution Control Standards and the Sykes Act," authorizes cooperation between state and federal agencies regarding the conservation of natural resources. Compliance with the state Erosion and Sediment Control and Stormwater Management programs through proper design and implementation is consistent with the mandate of these federal directives. Notwithstanding cooperation with the Department of Conservation and Recreation, federal agencies are responsible for ensuring compliance with the state program on regulated activities under their authority through separate agreements with contractors, training, field inspection, enforcement action, or other means that are consistent with agency policy and federal and state mandates.

7. Chesapeake Bay Preservation Act Compliance. Road and railway projects are conditionally exempt from the requirements of the Chesapeake Bay Preservation Area Designation and Management Regulations (9 VAC 10-20-10 et seq.) provided such

projects are constructed, operated, and maintained in accordance with the Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Act (or an equivalent local program). This conditional exemption also requires that road alignments and design prevent or otherwise minimize (i) encroachment in Resource Protection Areas, as defined in the Regulations, and (ii) adverse effects on water quality. Non-linear features of the project, such as parking lots and stations, are not exempt and must be consistent with the General Performance Criteria and the Development Criteria for Resource Protection Areas. (Both the General Performance Criteria and the Development Criteria are found in the Regulations.) During planning and design phases, site-specific surveys should be conducted to verify the presence or absence, and boundaries, of any Resource Protection Areas.

8. Recreation Resources. The Department of Conservation and Recreation has indicated that the proposed project will not affect any streams on the National Park Service Nationwide Inventory, Final List of Rivers, or existing or potential State Scenic Rivers. Nor will the project affect existing or potential State Scenic Byways.

9. Pesticides and Herbicides. If pesticides or herbicides must be used, their use should be strictly in accordance with manufacturers' recommendations. In addition, we recommend the use of the least toxic herbicides or pesticides effective for landscape maintenance. Products containing volatile organic compounds as their active ingredient should be avoided in order to protect air quality. For more information on this subject, please contact the Department of Agriculture and Consumer Services (telephone (804) 786-3501).

10. Forest and Tree Protection. According to the Department of Forestry, this project will not significantly affect forest lands of the Commonwealth.

In order to protect trees in project construction areas from the effects of this project, the trees should be marked and fenced at least to the dripline or the end of the root system, whichever extends farther from the tree stem. Marking should be done with highly visible ribbon so that equipment operators see the protected areas easily.

Parking and stacking of heavy equipment, construction materials, or soil stockpiles near trees can damage root systems by compacting the soil. Soil compaction, from weight or vibration, affects root growth, water and nutrient uptake, and gas exchange. If parking and stacking are unavoidable, temporary crossing bridges, or mats to minimize soil compaction and mechanical injury to plants, should be used. Soil stockpiles should be covered to prevent soil erosion and fugitive dust.

Questions on tree protection may be directed to the Department of Forestry (Mike Foreman, telephone (434) 977-6555).

11. Pollution Prevention. DEQ advocates that principles of pollution prevention be used in all construction projects as well as in facility operations. Effective siting, planning, and on-site Best Management Practices (BMPs) will help to ensure that environmental impacts are minimized. However, pollution prevention techniques also include decisions related to construction materials, design, and operational procedures that will facilitate the reduction of wastes at the source. We have several pollution prevention recommendations that may be helpful in constructing or operating this project:

- Consider development of an effective Environmental Management System (EMS). An effective EMS will ensure that the proposed facility is committed to minimizing its environmental impacts, setting environmental goals, and achieving improvements in its environmental performance. DEQ offers EMS development assistance and recognizes facilities with effective Environmental Management Systems through its Virginia Environmental Excellence Program.
- Consider environmental attributes when purchasing materials. For example, the extent of recycled material content, toxicity level, and amount of packaging should be considered and can be specified in purchasing contracts.
- Consider contractors' commitments to the environment (such as an EMS) when choosing contractors. Specifications regarding raw materials and construction practices can be included in contract documents and requests for proposals.
- Choose sustainable materials and practices for infrastructure and building construction and design. These could include asphalt and concrete containing recycled materials, and integrated pest management in landscaping, among other things.
- Integrate pollution prevention techniques into facility maintenance and operation, to include the following: inventory control (record-keeping and centralized storage for hazardous materials), product substitution (use of non-toxic cleaners), and source reduction (fixing leaks, energy-efficient HVAC and equipment). Maintenance facilities should be designed with sufficient and suitable space to allow for effective inventory control and preventive maintenance.

DEQ's Office of Pollution Prevention provides free information and technical assistance relating to pollution prevention techniques and EMS. If interested, the project manager may contact that Office (Tom Griffin, telephone (804) 698-4545).

12. Transportation Impacts. The Virginia Department of Transportation is of the opinion that any of the "build" alternatives described in the Draft EIS would be

preferable to the no-action alternative because of the beneficial impact of improved mass transit on congested areas in Northern Virginia, including Tysons Corner.

Regulatory and Coordination Needs

1. Solid and Hazardous Waste Management. Soil suspected of contamination, and wastes that are generated, must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations, including but not limited to the Virginia Waste Management Act (*Virginia Code* sections 10.1-1400 et seq.), the Virginia Hazardous Waste Management Regulations (9 VAC 20-60 et seq.), and the Virginia Solid Waste Management Regulations (9 VAC 20-80 et seq.). (See the attached comments from DEQ's Waste Division, Office of Remedial Programs.)

According to DEQ's Northern Virginia Regional Office, the Draft EIS mentions the identification of 34 contamination sites that were not identified in the Environmental Database Search results. We recommend that these sites be discussed with that Office (Charlie Forbes, Regional Permits Manager, telephone (703) 583-3850).

As mentioned above and in the Draft EIS, the structures to be demolished as part of this project have not yet been checked for the presence of asbestos-containing materials or lead-based paint. The following guidance pertains in the event either of these substances is found.

(a) Asbestos Abatement. If asbestos-containing materials (ACM) are found, following their classification as friable or non-friable, all waste ACM shall be disposed of in accordance with the Virginia Solid Waste Management Regulations (9 VAC 20-80-640), and transported in accordance with the Virginia regulations governing Transportation of Hazardous Materials (9 VAC 20-110-10 et seq.). The project manager should contact the DEQ Waste Management Program (telephone (804) 698-4021) and the Department of Labor and Industry, Dr. Clarence Wheeling, telephone (804) 786-0574 for additional information.

(b) Lead-Based Paint. The project must comply with the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) regulations, and with the Virginia Lead-Based Paint Activities Rules and Regulations. For additional information regarding these requirements, the project manager should contact the Department of Professional and Occupational Regulation (Thomas Perry, telephone (804) 367-8595).

2. Air Quality Regulation. As indicated above, heating units may require new source review or operating permits from DEQ. In addition, open burning activities may require an open burning permit. Questions on these matters, and inquiries about time-of-year restrictions on the use of cut-back asphalt, may be directed to DEQ's Northern

Virginia Regional Office (Terry Darton, Air Permits Manager, telephone (703) 583-3845).

3. Water Quality and Wetland Permitting. The Draft EIS addresses the need for obtaining Virginia Pollutant Discharge Elimination System (VPDES) Stormwater General Permits for construction activity that disturbs 5 or more acres of land (page 4-19, section 4.2.1). The project manager should be aware that the regulation on this subject is changing; sites that are between 1 and 5 acres will also be required to apply for coverage under this General Permit by March 10, 2003.

Stormwater management facilities are proposed along the route to handle storm flow from the system (Draft EIS, section 2, Figure 2.3-16). The project manager should work with DEQ to ensure that necessary VPDES permits are obtained for these facilities. If de-watering of the tunnels for the underground Metrorail stations is necessary, a VPDES permit might be necessary for discharges resulting from this activity.

Site-specific VPDES permits and/or VPDES Stormwater General Permits may also be needed for BRT stations and the Maintenance and Storage Facility contemplated under the BRT alternative.

Similarly, if the Metrorail alternative is selected, permits may be required for discharges from the Service and Inspection Yard. The Yard is to include a car wash and stormwater management facilities of its own. If flow from the car wash is discharged to the sanitary sewer, then an industrial user permit is likely to be required for the wastewater treatment plant accepting the flow.

The Draft EIS indicates that both VPDES and Virginia Water Protection Permits (VWPP) will be required for construction of the underground sections of the Metrorail, according to DEQ's Northern Virginia Regional Office. However, VWP permits will only be required if wetlands will be involved.

Questions on water permits may be addressed to DEQ's Northern Virginia Regional Office (Charlie Forbes, Regional Permits Manager, telephone (703) 583-3850).

4. Erosion Control; Stormwater Management. Questions relating to compliance with the Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Law may be addressed to the Department of Conservation and Recreation's Potomac Watershed Office (Mary Apostolico, telephone (540) 347-6420).

5. Subaqueous Bed Encroachment. Any encroachments in, on, or over state-owned subaqueous lands, along with the activities subject to water resource permitting identified in item 3 above, require the submission of a Joint Permit Application to the

Marine Resources Commission. The Commission acts as a clearinghouse for permit processing by itself, DEQ's Regional Offices, and the Army Corps of Engineers. Questions on the process, and on the Commission's permit jurisdiction, may be addressed to the Commission (Mark Eversole, telephone (757) 247-2200).

6. Federal Consistency under the Coastal Zone Management Act. Pursuant to the Coastal Zone Management Act of 1972, as amended, the lead federal agency is required to determine the consistency of its activities affecting Virginia's coastal resources or coastal uses with the Virginia Coastal Resources Management Program (VCP) (see section 307(c)(1) of the Act and 15 CFR Part 930, sub-part C, section 930.34). This involves an analysis of the activities in light of the Enforceable Programs of the VCP (first enclosure), and submission of a consistency determination reflecting that analysis and committing the federal agency to comply with the Enforceable Programs. This determination may be provided as part of the documentation concluding the NEPA process, or independently, depending on your agency's preference. Section 930.39 gives content requirements for the consistency determination. If you need clarification of these comments, please contact Charles Ellis at (804) 698-4488.

Thank you for the opportunity to review this Draft EIS. We look forward to reviewing the Final EIS for this project. Detailed comments of reviewing agencies are attached.

Sincerely,

Ellie L. Irons
Program Manager

Attachment 1

Enforceable Regulatory Programs comprising Virginia's Coastal Resources Management Program (VCP)

a. Fisheries Management - The program stresses the conservation and enhancement of finfish and shellfish resources and the promotion of commercial and recreational fisheries to maximize food production and recreational opportunities. This program is administered by the Marine Resources Commission (VMRC); Virginia Code §28.2-200 to §28.2-713 and the Department of Game and Inland Fisheries (DGIF); Virginia Code §29.1-100 to §29.1-570.

The State Tributyltin (TBT) Regulatory Program has been added to the Fisheries Management program. The General Assembly amended the Virginia Pesticide Use and Application Act as it related to the possession, sale, or use of marine antifoulant paints containing TBT. The use of TBT in boat paint constitutes a serious threat to important marine animal species. The TBT program monitors boating activities and boat painting activities to ensure compliance with TBT regulations promulgated pursuant to the amendment. The VMRC, DGIF, and Virginia Department of Agriculture Consumer Services (VDACS) share enforcement responsibilities; Virginia Code §3.1-249.59 to §3.1-249.62.

b. Subaqueous Lands Management - The management program for subaqueous lands establishes conditions for granting or denying permits to use state-owned bottomlands based on considerations of potential effects on marine and fisheries resources, tidal wetlands, adjacent or nearby properties, anticipated public and private benefits, and water quality standards established by the Department of Environmental Quality (DEQ). The program is administered by the Marine Resources Commission; Virginia Code §28.2-1200 to §28.2-1213.

c. Wetlands Management - The purpose of the wetlands management program is to preserve wetlands, prevent their despoliation, and accommodate economic development in a manner consistent with wetlands preservation.

(1) The tidal wetlands program is administered by the Marine Resources Commission; Virginia Code §28.2-1301 through §28.2-1320.

(2) The Virginia Water Protection Permit program administered by DEQ includes protection of wetlands --both tidal and non-tidal; Virginia Code §62.1-44.15:5 and Water Quality Certification pursuant to Section 401 of the Clean Water Act.

d. Dunes Management - Dune protection is carried out pursuant to The Coastal Primary Sand Dune Protection Act and is intended to prevent destruction or alteration of primary dunes. This program is administered by the Marine Resources Commission; Virginia Code §28.2-1400 through §28.2-1420.

e. Non-point Source Pollution Control – (1) Virginia's Erosion and Sediment Control Law requires soil-disturbing projects to be designed to reduce soil erosion and to decrease inputs of chemical nutrients and sediments to the Chesapeake Bay, its tributaries, and other rivers and waters of the Commonwealth. This program is administered by the Department of Conservation and Recreation; Virginia Code §10.1-560 et.seq.).

(2) Coastal Lands Management is a state-local cooperative program administered by the Chesapeake Bay Local Assistance Department and 84 localities in Tidewater (see i) Virginia; Virginia Code §10.1-2100 –10.1-2114 and 9 VAC10-20 et seq.

f. Point Source Pollution Control - The point source program is administered by the State Water Control Board (DEQ) pursuant to Virginia Code §62.1-44.15. Point source pollution control is accomplished through the implementation of:

(1) the National Pollutant Discharge Elimination System (NPDES) permit program established pursuant to Section 402 of the federal Clean Water Act and administered in Virginia as the Virginia Pollutant Discharge Elimination System (VPDES) permit program.

(2) The Virginia Water Protection Permit (VWPP) program administered by DEQ; Virginia Code §62.1-44.15:5 and Water Quality Certification pursuant to Section 401 of the Clean Water Act.

g. Shoreline Sanitation - The purpose of this program is to regulate the installation of septic tanks, set standards concerning soil types suitable for septic tanks, and specify minimum distances that tanks must be placed away from streams, rivers, and other waters of the Commonwealth. This program is administered by the Department of Health (Virginia Code §32.1-164 through §32.1-165).

h. Air Pollution Control - The program implements the federal Clean Air Act to provide a legally enforceable State Implementation Plan for the attainment and maintenance of the National Ambient Air Quality Standards. This program is administered by the State Air Pollution Control Board (Virginia Code §10.1-1300 through §10.1- 1320).

(i) Coastal Lands Management is a state-local cooperative program administered by the Chesapeake Bay Local Assistance Department and 84 localities in Tidewater, Virginia established pursuant to the Chesapeake Bay Preservation Act; Virginia Code §10.1-2100 –10.1-2114 and Chesapeake Bay Preservation Area Designation and Management Regulations; Virginia Administrative Code 9 VAC10-20 et seq.

Attachment 2

Advisory Policies for Geographic Areas of Particular Concern

a. Coastal Natural Resource Areas - These areas are vital to estuarine and marine ecosystems and/or are of great importance to areas immediately inland of the shoreline. Such areas receive special attention from the Commonwealth because of their conservation, recreational, ecological, and aesthetic values. These areas are worthy of special consideration in any planning or resources management process and include the following resources:

a) Wetlands
b) Aquatic Spawning, Nursery, and Feeding Grounds
c) Coastal Primary Sand Dunes
d) Barrier Islands
e) Significant Wildlife Habitat Areas
f) Public Recreation Areas
g) Sand and Gravel Resources
h) Underwater Historic Sites.

b. Coastal Natural Hazard Areas - This policy covers areas vulnerable to continuing and severe erosion and areas susceptible to potential damage from wind, tidal, and storm related events including flooding. New buildings and other structures should be designed and sited to minimize the potential for property damage due to storms or shoreline erosion. The areas of concern are as follows:

i) Highly Erodible Areas
ii) Coastal High Hazard Areas, including flood plains.

c. Waterfront Development Areas - These areas are vital to the Commonwealth because of the limited number of areas suitable for waterfront activities. The areas of concern are as follows:

i) Commercial Ports
ii) Commercial Fishing Piers
iii) Community Waterfronts

Although the management of such areas is the responsibility of local government and some regional authorities, designation of these areas as Waterfront Development Areas of Particular Concern (APC) under the VCRMP is encouraged. Designation will allow the use of federal CZMA funds to be used to assist planning for such areas and the implementation of such plans. The VCRMP recognizes two broad classes of priority uses for waterfront development APC:

Attachment 2 con't

i) water access dependent activities;
ii) activities significantly enhanced by the waterfront location and complementary to other existing and/or planned activities in a given waterfront area.

Advisory Policies for Shorefront Access Planning and Protection

a. Virginia Public Beaches - Approximately 25 miles of public beaches are located in the cities, counties, and towns of Virginia exclusive of public beaches on state and federal land. These public shoreline areas will be maintained to allow public access to recreational resources.

b. Virginia Outdoors Plan - Planning for coastal access is provided by the Department of Conservation and Recreation in cooperation with other state and local government agencies. The Virginia Outdoors Plan (VOP), which is published by the Department, identifies recreational facilities in the Commonwealth that provide recreational access. The VOP also serves to identify future needs of the Commonwealth in relation to the provision of recreational opportunities and shoreline access. Prior to initiating any project, consideration should be given to the proximity of the project site to recreational resources identified in the VOP.

c. Parks, Natural Areas, and Wildlife Management Areas - Parks, Wildlife Management Areas, and Natural Areas are provided for the recreational pleasure of the citizens of the Commonwealth and the nation by local, state, and federal agencies. The recreational values of these areas should be protected and maintained.

d. Waterfront Recreational Land Acquisition - It is the policy of the Commonwealth to protect areas, properties, lands, or any estate or interest therein, of scenic beauty, recreational utility, historical interest, or unusual features which may be acquired, preserved, and maintained for the citizens of the Commonwealth.

e. Waterfront Recreational Facilities - This policy applies to the provision of boat ramps, public landings, and bridges which provide water access to the citizens of the Commonwealth. These facilities shall be designed, constructed, and maintained to provide points of water access when and where practicable.

f. Waterfront Historic Properties - The Commonwealth has a long history of settlement and development, and much of that history has involved both shorelines and near-shore areas. The protection and preservation of historic shorefront properties is primarily the responsibility of the Department of Historic Resources. Buildings, structures, and sites of historical, architectural, and/or archaeological interest are significant resources for the citizens of the Commonwealth. It is the policy of the

If you cannot meet the deadline, please notify CHARLIE ELLIS at 804/698-4488 prior to the date given. Arrangements will be made to extend the date for your review if possible. An agency will not be considered to have reviewed a document if no comments are received (or contact is made) within the period specified.

REVIEW INSTRUCTIONS:

A. Please review the document carefully. If the proposal has been reviewed earlier (i.e. if the document is a federal Final EIS or a state supplement), please consider whether your earlier comments have been adequately addressed.

B. Prepare your agency's comments in a form which would be acceptable for responding directly to a project proponent agency.

C. Use your agency stationery or the space below for your comments. **IF YOU USE THE SPACE BELOW, THE FORM MUST BE SIGNED AND DATED.**

Please return your comments to:

MEMORANDUM

DATE: 1 August 2002

TO: Charles H. Ellis, III, Virginia Department of Environmental Quality

Derral Jones

FROM: Derral Jones, Planning Bureau Manager

SUBJECT: Draft Environmental Impact Statement and Section 4 (f) evaluation for the Dulles Rapid Transit Corridor

In January 2002, the Department of Conservation and Recreation (DCR) submitted comments on this project to the Washington Metropolitan Area Transit Authority. To reiterate those comments for your use : The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered species, unique or exemplary natural communities, and significant geologic formations.

According to the information currently in our files, several rare plants, which are typically associated with prairie vegetation and inhabit semi-open diabase glades in Virginia, may occur at this location if suitable habitat is present. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia counties and is located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plants occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction (Rawinski, 1995).

In Northern Virginia, diabase supports occurrences of several global and state rare plant species: earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), white heath aster (*Aster ericoides*, G5/S2/NF/NS), blue-hearts (*Buchnera americana*, G3G4/S1/NF/NS), hairy beardtongue (*Penstemon hirsutus*, G4/S2/NF/NS), downy phlox (*Phlox pilosa*, G5T5/S2/NF/NS), stiff goldenrod (*Oligoneuron rigidum* var. *rigidum*, G5/S2/NF/NS), and marsh hedgenettle (*Stachys pilosa* var. *arenicola*,

G5/S1/NF/NS). Please note that earleaf foxglove is currently tracked as a species of concern by the United States Fish and Wildlife Service (USFWS); however this designation has no official legal status.

Due to the potential for this site to support populations of natural heritage resources, DCR recommends an inventory of suitable habitat in the study area. With the survey results we can more accurately evaluate potential impacts to natural heritage resources and offer specific protection recommendations for minimizing impacts to the documented resources.

DCR-Division of Natural Heritage biologists are qualified and available to conduct inventories for rare, threatened, and endangered species. Please contact J. Christopher Ludwig, Natural Heritage Inventory Manager, at (804) 371-6206 to discuss arrangements for field work. A list of other individuals who are qualified to conduct inventories may be obtained from the USFWS.

Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks other natural heritage resources. DCR's Biological and Conservation Data System is continuously revised. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized."

The Draft Environmental Impact Statement, discusses some of these issues in 4.5.3: Existing Conditions, pp. 4-77 thru 4-81, and states on page 81, the indication of the "absence of suitable habitat for rare diabase plants". That should be re-evaluated with a survey during the appropriate season. DCR has not surveyed any sites within the project area, but recommends doing so either this month or during September, if possible. As stated above, DCR-Division of Natural Heritage biologists are qualified and available to conduct inventories for rare, threatened, and endangered species. Please contact J. Christopher Ludwig, Natural Heritage Inventory Manager, at (804) 371-6206 to discuss arrangements for field work.

Lastly, the proposed project is not anticipated to have any adverse impacts on existing or planned recreational facilities. Nor will it impact any streams on the National Park Service Nationwide Inventory, Final List of Rivers, potential Scenic Rivers or existing or potential State Scenic Byways. Please contact DCR for an update on this information if a significant amount of time passes before it is utilized.

Thank you for the opportunity to offer comments on this project.

Definition of Abbreviations Used on Natural Heritage Resource Lists of the Virginia Department of Conservation and Recreation

Natural Heritage Ranks

The following ranks are used by the Virginia Department of Conservation and Recreation to set protection priorities for natural heritage resources. Natural Heritage Resources, or "NHR's," are rare plant and animal species, rare and exemplary natural communities, and significant geologic features. The primary criterion for ranking NHR's is the number of populations or occurrences, i.e. the number of known distinct localities. Also of great importance is the number of individuals in existence at each locality or, if a highly mobile organism (e.g., sea turtles, many birds, and butterflies), the total number of individuals. Other considerations may include the quality of the occurrences, the number of

protected occurrences, and threats. However, the emphasis remains on the number of populations or occurrences such that ranks will be an index of known biological rarity.

S1 Extremely rare; usually 5 or fewer populations or occurrences in the state; or may be a few remaining individuals; often especially vulnerable to extirpation.

S2 Very rare; usually between 5 and 20 populations or occurrences; or with many individuals in fewer occurrences; often susceptible to becoming extirpated.

S3 Rare to uncommon; usually between 20 and 100 populations or occurrences; may have fewer occurrences, but with a large number of individuals in some populations; may be susceptible to large-scale disturbances.

S4 Common; usually >100 populations or occurrences, but may be fewer with many large populations; may be restricted to only a portion of the state; usually not susceptible to immediate threats.

S5 Very common; demonstrably secure under present conditions.

SA Accidental in the state.

S#B Breeding status of an organism within the state.

SH Historically known from the state, but not verified for an extended period, usually > 15 years; this rank is used primarily when inventory has been attempted recently.

S#N Non-breeding status within the state. Usually applied to winter resident species.

SU Status uncertain, often because of low search effort or cryptic nature of the element.

SX Apparently extirpated from the state.

SZ Long distance migrant whose occurrences during migration are too irregular, transitory and/or dispersed to be reliably identified, mapped and protected.

Global ranks are similar, but refer to a species' rarity throughout its total range. Global ranks are denoted with a "G" followed by a character. Note that GA and GN are not used and GX means apparently extinct. A "Q" in a rank indicates that a taxonomic question concerning that species exists. Ranks for subspecies are denoted with a "T". The global and state ranks combined (e.g. G2/S1) give an instant grasp of a species' known rarity.

These ranks should not be interpreted as legal designations.

Federal Legal Status

The Division of Natural Heritage uses the standard abbreviations for Federal endangerment developed by the U.S. Fish and Wildlife Service, Division of Endangered Species and Habitat Conservation.

LE	Listed Endangered - threatened with extinction throughout all or a significant portion of its range		
LT	Listed Threatened - likely to become endangered in the foreseeable future		
PE	Proposed Endangered	E(S/A)	Treat as endangered because of similarity of appearance
PT	Proposed Threatened	T(S/A)	Treat as threatened because of similarity of appearance
C	Candidate - enough information is available to propose for listing, but listing is precluded by other pending proposals of higher priority		
SOC	Species of Concern -- species that merit special concern (not a regulatory category)		
NF	No federal legal status		

State Legal Status

The Division of Natural Heritage uses similar abbreviations for State endangerment.

LE	Listed Endangered	PE	Proposed Endangered
LT	Listed Threatened	PT	Proposed Threatened
C	Candidate		
SC	Special Concern -- animals that merit special concern according to VDGIF (not a regulatory category)		
NS	No state legal status		

Conservation Site Ranks

A rank is a rating of the significance of the conservation site based on presence and number of natural heritage resources; on a scale of 1-5, 1 being most significant.

B1 - Outstanding significance
B2 - Very high significance
B3 - High significance
B4 - Moderate significance
B5 - of General Biodiversity significance

Site names ending in Habitat Zone are B5 sites on private lands.

For information on the laws pertaining to threatened or endangered species, contact: U.S. Fish and Wildlife Service for all FEDERALLY listed species Department of Agriculture and Consumer Services Plant Protection Bureau for STATE listed plants and insects; Department of Game and Inland Fisheries for all other STATE listed animals

If you cannot meet the deadline, please notify CHARLIE ELLIS at 804/698-4488 prior to the date given. Arrangements will be made to extend the date for your review if possible. An agency will not be considered to have reviewed a document if no comments are received (or contact is made) within the period specified.

DATE: July 29, 2002

COPIES: Kevin Greene

RECEIVED
AUG 1 - 2002
DEQ-Office of Environmental Impact Review

SUBJECT: Draft Environmental Impact Statement
Dulles Corridor Rapid Transit Project

The Office of Remedial Programs has reviewed the Federal Transit Administration's Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement. We have the following comments concerning the waste issues associated with this project.

Hazardous and solid waste issues and sites were addressed in the report. The central office of the Waste Division did a cursory review of its data files and did not find any additional sites that might impact this project.

Since this project may involve construction, any soil that is suspected of contamination or wastes that are generated must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations. Some of the applicable state laws and regulations are: Virginia Waste Management Act, Code of Virginia Section 10.1-1400 *et seq.*; Virginia Hazardous Waste Management Regulations (VHWMR) (9VAC 20-60); Virginia Solid Waste Management Regulations (VSWMR) (9VAC 20-80); Virginia Regulations for the Transportation of Hazardous Materials (9VAC 20-110). Some of the applicable Federal laws and regulations are: the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Section 6901 *et seq.*, and the applicable regulations contained in Title 40 of the Code of Federal Regulations; and the U.S. Department of Transportation Rules for Transportation of Hazardous Materials, 49 CFR Parts 107, 171.1-172.558.

The report states that structures to be demolished not have been checked for the presence of asbestos-containing materials (ACM) or lead-based paint (LBP). They should be

checked and if LBP or ACM are found, in addition to the Federal waste-related regulations, State regulations 9VAC 20-80-640 for ACM and 9VAC 20-60-261 for LBP must be followed.

Finally, pollution prevention was not addressed in the report. VDEQ encourages all construction projects and facilities to implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated.

If you have any questions or need further information, please let me know.

3. X **9 VAC 5-40-5490 et seq. – Asphalt Paving operations**
4. X **9 VAC 5-40-5600 et seq. – Open Burning**
5. X **9 VAC 5-50-60 et seq. Fugitive Dust Emissions**
6. ☐ 9 VAC 5-50-130 et seq. - Odorous Emissions; Applicable to
7. ☐ 9 VAC 5-50-160 et seq. – Standards of Performance for Toxic Pollutants
8. ☐ 9 VAC 5-50-400 Subpart_____, Standards of Performance for New Stationary Sources, designates standards of performance for the
9. ☐ 9 VAC 5-80-10 et seq. of the regulations – Permits for Stationary Sources
10. ☐ 9 VAC 5-80-1700 et seq. Of the regulations – Major or Modified Sources located in PSD areas. This rule may be applicable to the
11. ☐ 9 VAC 5-80-2000 et seq. of the regulations – New and modified sources located in non-attainment areas
12. ☐ 9 VAC 5-80-800 et seq. Of the regulations – Operating Permits and exemptions. This rule may be applicable to

COMMENTS SPECIFIC TO THE PROJECT:

Results of detailed modeling studies have established that operation of any alternative considered has no significant effect on air quality. The project being in an ozone non-attainment area, all precautions are to be taken during the construction phase to restrict the emissions of volatile organic compounds (VOC) and oxides of nitrogen (NOx).

Comments:

VWPP – The Department of Environmental Quality (DEQ) Virginia Water Protection Permit Program has reviewed the DEIS for the Dulles Corridor Rapid Transit Project. We recognize the importance of this project. The scope of work includes the extension of mass transit service through the Dulles corridor. Thank you for the thorough report on potential impacts to state waters and for addressing efforts and requirements to avoid, minimize and compensate for the impacts.

The DEIS indicates all Build Alternatives will impact state waters, including wetlands. All attempts should be made to select the most feasible alternative that also avoids and minimizes potential direct and indirect impacts to wetlands and streams to the greatest extent practicable. We understand that impacts have been avoided and minimized by limiting proposed construction to the median of existing roadways as much as practicable. As the project progresses, please continue to investigate ways for additional avoidance and minimization of direct and indirect impacts to wetlands and streams to the greatest extent practicable. Examples of avoidance and minimization efforts include completely spanning wetlands to avoid impact and shifting the alignment to avoid or minimize wetland impacts. The selected alternative's unavoidable impacts to wetlands and streams will require full compensatory mitigation as explained in the DEIS.

This project may require a Virginia Water Protection Permit, which includes coordination of this project with the Virginia Marine Resources Commission, the Army Corps of Engineers and the DEQ through the Joint Permit Application process.

Appropriate design and construction measures should be employed to avoid and minimize impacts to state waters during construction. All applicable best management practices should be used to minimize potential impacts. Machinery should be kept out of waterway and wetlands when possible. Machinery that must be operated within wetland areas should be maintained on mats in order to prevent tire rutting. In general, DEQ encourages the use of erosion and sediment control measures, adherence to storm water management regulations, and careful construction practices to minimize temporary impacts to state waters during site construction activities.

VPDES/VPA: VPDES Storm water permits for construction activity will be necessary.

PROJECT # 02-124F

RECEIVED
AUG 09 2002
DEQ-Office of Environmental Impact Review

Forbes,Charles

To: Ellis,Charles
Subject: OEIR 02-124F - Dulles Rapid Transit Project Draft EIS

The purpose of this EM is to provide NRO review comments.

1) The Draft EIS addresses the need for obtaining Virginia Pollutant Discharge Elimination System (VPDES) construction permits for construction activity that disturbs five or more acres of land (Section 4.2). The Development Authority should be aware that the regulation is changing for the permitting of construction activities to include all sites that are between one and five acres of land. This regulation requires all construction sites that are one acre or more to apply for coverage by March 10, 2003.
2) Stormwater Management Facilities (Section 2, Figure 2.3-16) are proposed along the route to handle storm flow from the system. The Development Authority should coordinate with DEQ as the project progresses to insure that all necessary VPDES permits are obtained for the stormwater management facilities. If dewatering of the tunnels for the underground Metrorail stations is necessary, then a VPDES permit could be necessary for any discharges from this activity.
3) If the BRT alternative is selected, then the Development Authority should coordinate with DEQ to obtain any necessary general stormwater or site specific VPDES permits for the BRT stations and for the BRT Maintenance & Storage Facility.
4) The Draft EIS describes a Metrorail Service and Inspection Yard that will be needed if the Metrorail alternative is selected. This yard will include a car wash and stormwater management facilities. If this option is selected, then there will need to be coordination with DEQ to ensure that any necessary permits are obtained for the discharges from the Yard. If flow from the car wash is discharged to the sanitary sewer, then an industrial user permit will most likely be necessary with the wastewater treatment plant accepting the flow.
5) NRO is unable to assess whether the cost of obtaining and maintaining environmental permits is addressed in the Operations & Maintenance costs estimates. Permit application fees were raised as of July 1, 2002. Similarly, it is unclear if the possibility of paying for the cost of permit-driven sampling and analysis has been considered in estimates. Most VPDES permits require flow estimates and analysis for a variety of parameters, based on the activities conducted at a site and the reasonable potential for the discharge of pollutants.
6) The Draft EIS states that both VPDES and Virginia Water Protection Permits (VWPP) will be obtained for construction of the underground sections of the Metrorail. VWPP permits will only be required if wetlands will be involved.
7) Section 4.9 discusses field reconnaissance done in the study area and the identification of thirty-four (34) sites that were not identified in the Environmental Database Search results. Will these sites be discussed with DEQ?

In general, the document states in numerous sections that ***all*** necessary environmental permits will be obtained, which satisfies the thrust of NRO concerns. However, close coordination with the various federal, state, and local authorities will be key to ensuring that a project of this magnitude is completed with minimal environmental damage.

A copy of this EM and the requisite OEIR paperwork will follow shortly.

Regards

CDF

All work to be performed in waters and tidal wetlands within the Commonwealth of Virginia requires the submission of a Joint Permit Application (JPA) to the Virginia Marine Resources Commission (VMRC). VMRC would then act as the clearing house, distributing copies of the application to state, local and federal agencies for review and comments.

The review and permitting process normally requires a minimum of 90 days, so it is advised to contact this agency early in the planning phase, to allow ample time for public notice and permitting.

Copies of the JPA are available on the internet, or by contacting this office.

Re: Dulles Corridor Rapid Transit Project
DEQ Project Number 02-124F
DHR File Numbers 2000-1061

Dear Mr. Ellis:

Thank you for requesting our comments on the Dulles Corridor Rapid Transit Project. We are currently working with the FTA, USDOT, VDRPT, WMATA, the FAA, and their consultant, Parsons Engineering Science, Inc., on the identification of historic properties within the proposed transportation corridor. Currently, Parsons is drafting a Programmatic Agreement among the federal and state agencies and our department. This programmatic will outline the procedures to be followed in the identification and evaluation of historic properties as well as plan for the mitigation of effects to properties eligible for listing on the National Register of Historic Places. We encourage the federal and state agencies involved to continue coordinating with our office as the project evolves.

Thank you again for the opportunity to review and comment. If you have any questions or if we can be of any further assistance do not hesitate to contact me at (804) 367-2323 ext. 140 or lrichards@dhr.state.va.us.

Sincerely,

RE: Dulles Corridor Rapid Transit Project
CBLAD Project Review No.: SSPR-VDOT-05-02

Dear Mr. Ellis:

As you requested, we have reviewed the Draft Environmental Impact Statement for the proposed Dulles Corridor Rapid Transit Project. During the siting and design phases of the project the following should be taken into consideration. Roadway and railroad projects are conditionally exempt from the requirements of the Chesapeake Bay Preservation Area Designation and Management Regulations (Regulations) provided they are constructed, operated and maintained in accordance with the Erosion and Sediment Control Law and the Virginia Stormwater Management Act (or equivalent local program). This conditional exemption also requires that roadway alignments and design be optimized to prevent or otherwise minimize (i) encroachment in the Resource Protection Area and (ii) adverse effects on water quality. Nonlinear features of the project, such as parking lots and stations, are not exempt and are required to be consistent with the General Performance Criteria and the Development Criteria for Resource Protection Areas of the Regulations. During the planning and design phases, site-specific surveys should be conducted to verify the presence/absence and boundaries of any Resource Protection Areas.

We appreciate the opportunity to provide our comments on this project. Please do not hesitate to contact us at 1-800-CHESBAY should you have any questions.

Sincerely,

Catherine M. Harold
Environmental Engineer

Re **Dulles Corridor Rapid Transit Project**
DHR File # 2000-1061

Dear Mr **.Rohrer:**

We have received for review a copy of the report *Identification and Evaluation Report - Archaeology* {2004) which discusses the archaeological investigation of the project area as conducted by Gray & Pape. We are pleased to inform you that the report meets the Secretary of the Interior's *Standards and Guidelines for the Documentation of Archaeological Sites* (48 FR 44734-44742). However, the format of this report does not conform to our Department's *Survey Guidelines* (revised 200 1). We ask that a report conforming to these standards be forwarded to our office at your earliest convenience. A copy of our Guidelines may be obtained by accessing our website at
h ://state.vi net.or dhr/arch DHR/archaeo index.htm.

Survey of the project area resulted in the identification of nine isolated locations. No archaeological sites were identified as a result of this survey. Although several sites have been previously identified within or adjacent to the Area of Potential Effect, no evidence of any such site was identified during this survey. The consultant indicates that modem construction, land use, and inundation rendered much of the project area unlikely to contain intact cultural deposits. Based upon the information provided, therefore, we concur with the recommendation that no archaeological properties will be affected by this project as currently planned.

If you have any questions about the Section 106 review process or our comments, please call me at (804) 367-2323, Ext. 140.

Sincerely,,

Re: Dulles Corridor Rapid Transit Project
Supplemental Draft Environmental Impact Statement (EIS)
Fairfax and Loudoun Counties
DHR File # 2000-1061

Dear Mr .Rohrer:

We have received the "Identification and Evaluation Report-Historic Architecture" for our review and comment regarding the above referenced project. The report records the results of the architectural survey for the length of the 23.1-mile project corridor. The Area of Potential Effect (APE) for architectural properties extends to 600 feet on either side of the centerlineand included all buildings fifty years old or older.

The project consultants identified and recorded a total of 83 previously undocumented architectural properties within the APE. These newly recorded properties consist of 82 individual resources and 1 potential district. Additionally, Washington Dulles International Airport Historic District, a resource previously determined eligible for listing in the National Register of Historic Places, is also located in the project APE. The project consultants only recommend one other property as potentially worthy of National Register listing. This is the multi-family dwelling at 6714-6716 Osborn Street (DHR Survey No.029-5395). It is recommended as eligible under Criterion A (as a representative of rental housing at a more moderate scale) and Criterion C (for its architectural merit).

We concur with your evaluation of those properties recommended as not eligible for listing in the National Register. The building stoc~ represented in the project survey is largely of undistinguished design without any association to a known historic event or significant individual.

We disagree, however, with your assertion that the multi-family dwelling at 6114-6116 Osbom Street is worthy of National Register listing. Although a more substantial and architecturally interesting building than others included in the project survey, the Colonial Revival residence is less impressive when compared to others of its type. Additionally, the loss of its original windows represents a significant diminishment of its historic integrity .For these reasons we do not believe that 6114-6116 Osbom Street is eligible for the National Register.

We reiterate the National Register eligibility of Washington Dulles International Airport Historic District under Criteria A, B, and C. We also restate our concurrence expressed in our March 4, 2004 letter that the eastern boundary for the historic district should be established approximately 300 feet east of the Fairfax/Loudoun County line. This boundary location would preserve the "peek-a-boo" sequence that is essential to the Saarinen design.

We concur with the project consultants that the LPA's location within the boundary of the historic district and its interference with the three remaining "peek-a-boo" sequences of the original Saarinen design constitute an adverse effect on the National Register-eligible Washington Dulles International Airport Historic District. It is our understanding that the Department of Rail and Public Transportation (DRPT) and the Washington Metropolitan Area Transit Authority (WMA T A) continue to refme the project design. As this process progresses, we request that you continue to consult with DHR regarding this undertaking. If DRPT and WMATA find that the adverse affect cannot be avoided, then it will become necessary to develop a Memorandum of Agreement (MOA) for the project.

If you have any questions about the Section 106 review process or our comments, please call me at (804) 367-2323, Ext. 114.

Sincerely,

Marc Holma, , **Archk'ctural Historian Office of Review and Compliance**

Re: Dulles Corridor Rapid Transit Project
Supplemental Draft Environmental Impact Statement (EIS)
Fairfax and Loudoun Counties
DHR File # 2000-1061

Dear Mr. Rohrer:

We have received your request for our review and comment on the Environmental Impact Statement (EIS) regarding the above referenced project. The document attempts to address the environmental affects that the proposed construction of the 23-mile high-capacity transit line will have to include those on historic properties. Please accept the following comments as our response to the current EIS.

The subject document attempts to address "the potential long-term and construction effects" of the Dulles Corridor Rapid Transit Project for the Local Preferred Alternative (LPA). The EIS evaluates the effects of the project on two archaeological sites (44FX2662 and 44FX2405) and an historic district (Hunter Mill Road Historic District) newly added for consideration since the last draft EIS. Additionally, the current EIS re-considers effects on the Washington Dulles International Airport, a property eligible for listing in the National Register of Historic Resources, and a House located at 22017 Shellhorn Road in Ryan.

The revised EIS asserts that there would be no adverse effect to architectural resources as a result of the LPA. We cannot concur with this statement. The project corridor crosses the boundary of the Hunter Mill Road Historic District. Despite the claim that "because the Hunter Mill Road Historic District is located within an existing transportation corridor, impacts to the district associated with this project would be minimal," you have not provided the Department of Historic Resources (DHR) sufficient information in order for us to agree with this statement. Similarly, the report cites "further analysis" confirming that the proposed LPA would not cause an adverse visual effect on the "peekaboo" sequence along the approach to Dulles Airport. We have not had the opportunity to review and comment on the aforementioned analysis. Therefore, we cannot agree that your assertion is correct. In fact, the issue of an appropriate National Register boundary for the airport is still an outstanding issue that must be settled before the discussion of effect can happen.

We welcome the opportunity to discuss this project further at our next scheduled Section 106 meeting on December 16, 2003. At that meeting we will also continue our dialogue regarding the development of a Programmatic Agreement (PA) for the undertaking. We request that you continue to consult with DHR through the Section 106 process on this undertaking.

If you have any questions about the Section 106 review process or our comments, please call me at (804) 367-2323, Ext. 114.

Sincerely,

Marc Holma, Architectural Historian

Re: Dulles Corridor Rapid Transit Project
DHR File Numbers 2000-1061

Dear Mr. Hill:

Thank you for providing our department with a copy of the Dulles Rapid Transit Project Public Hearings Report. We would like to reiterate that we look forward to working with your department, along with the federal agencies involved, in the successful completion of the Section 106 process for this project.

To date, the Section 106 process has not yet been initiated. Other than an initial meeting held on February 28, 2001, we have received no information regarding NHPA compliance. It is our understanding that the identification of previously identified historic properties is well under way and that the consultant will begin the identification of previously unidentified properties in the near future. Please bear in mind that the VDRPT and FTA will need SHPO concurrence on all eligibility and effect determinations.

Thank you again for the opportunity to review and comment on the referenced document. If you have any questions or if we can be of any further assistance do not hesitate to contact me at (804) 367-2323 ext. 140, lrichards@dhr.state.va.us or Marc Holma at ext. 114, mholma@dhr.state.va.us.

Sincerely,

Lily A. Richards
Archaeologist and Historian, Office of Review and Compliance

Subject: FW: Comments on February 2004 DCRTP Public Hearings Report on SDEIS - Docket No. R03-6
Importance: High

The Northern Virginia District Office of the Virginia Department of Transportation (VDOT) has reviewed the February 2004 *Public Hearings Report* (PHR) for the Supplemental Draft Environmental Impact Statement (EIS) and General Plans for the Dulles Corridor Rapid Transit Project (Docket Number R03-6). Thank you for the Project Team's responses to our comments on the October 2003 Supplemental Draft EIS package.

VDOT reaffirms its full support for the State's identification of this project as a high priority project for the region. We present to you the following comments and suggestions and look forward to continued coordination with the Project Team, with the common goal of improved overall transportation in the region. Our comments are as follows:

- **Mitigation Measures** - In the PHR, the Project Team states that proposed mitigation measures are not part of the Project capital cost[1]. However, on p. 129 of the PHR[2], the Project Team states that costs for mitigation of project impacts (noise, visual and traffic) *are* included as part of the Project's capital costs. Please clarify what mitigation measures are not included as part of the Project's capital cost and the reason for that decision. As mentioned in previous comments, VDOT believes that the traffic mitigation measures listed in the Supplemental Draft EIS do not fully address the future impact of this project on the existing transportation system. All Project-related impacts should be addressed, mitigated, and included in the Project's capital costs.

- **Noise Abatement** - In the PHR, it is stated that the noise methodology for this project followed FTA guidelines appropriate to transit projects[3]. In light of the current Council of Environmental Quality's (CEQ's) NEPA regulations[4], the project must include a comparative analysis of all alternatives (including the No Build Alternative). Therefore, VDOT interprets that any and all environmental impacts (including noise) will be addressed as part of the project and conform with

CEQ's current requirements.

- **Station Access** - VDOT looks forward to continued coordination by the Project Team in determining how to provide complete station access during preliminary engineering. VDOT recommends that the Project consider improving pedestrian and bicycle connections in the general vicinity (within 1 mile radius) of the proposed Station locations. VDOT looks forward to continued coordination on issues of station access - including bicycle/pedestrian, taxi, bus, park and ride, kiss and ride, etc.[5]

Please reference the possible future profile of Route 7 that would conflict with the relocation of the Tysons Central 7 Station entrance[6] and specifically describe the conflict. It should be noted that any future roadway improvements envisioned in Tysons Corner are based on the Fairfax County Comprehensive Plan 2000 and were applied in VDOT's Transportation Collocation Study 2003. The design shown in the Collocation Study is just one possible future option for Route 7 in the vicinity of Tysons Central 7 and no profiles for this design have been published by VDOT. Further analysis is required to determine if moving the station entrance to the middle or west side is feasible.

- **Station Access by Other Modes** - WMATA has listed bicycle and pedestrian accessible routes as the lowest priority for access and proximity to a station[7]. VDOT recommends that in areas where no commuter parking is proposed, such as in Tysons Corner, these modes of transportation (bicycle and pedestrian) should be given a higher priority.

- **Final EIS** - VDOT understands that an updated traffic analysis will be performed during the Final EIS[8] and looks forward to working with the Project team during this critical stage to determine adequate mitigation measures for the project. This traffic analysis should address impacts on the existing transportation system in general. Impacts will likely be far-reaching and not just limited to the immediate vicinities of the rail stations.

- **Preliminary Engineering** - As indicated by the Project Team in the PHR and particularly in view of new federal requirements regarding maintenance of traffic for every phase of construction, VDOT looks forward to being part of the future business advisory team during preliminary engineering[9] to discuss and minimize construction effects and maintenance of traffic in Tysons Corner and possibly elsewhere within the project limits (i.e., Beltway/Route 123 interchange, Reston).

The PHR indicates that congestion management will be addressed during preliminary engineering.[10] VDOT anticipates coordination by the Project Team on a congestion management plan during this phase of the project.

- **Revised General Plans** - VDOT is aware of the revisions proposed for the General Plans (PHR, A2). VDOT fully supports continuing, with full participation of transportation staff from Fairfax and Loudoun Counties as well as MWAA and TRIP II, a combined coordination effort with the DCRTP team to insure that the proposed rail alignments and station locations do not preclude potential future roadway improvements.

Thank you again for this opportunity for VDOT to provide comments and participate in this important project.

---

[1] *"The Final EIS process will identify the needed mitigation measures. These improvements will be programmed by DRPT or VDOT to complete construction by the dates identified in the Supplemental Draft EIS."* (PHR, p. 86)

"The recommended improvements are not proposed as part of the Project. These improvements would be the responsibility of VDOT and the Project Team has shared your comment with them." (PHR, p. 87)

"The timing of mitigation improvements... VDOT may expedite any improvements if needed to address current traffic problems prior to completion of the project." (PHR, p. 88)

"The pedestrian circulation system identified by commenter noted would be the responsibility of local governments and/or the Commonwealth of Virginia, and would not be part of the Dulles Corridor Rapid Transit Project." (PHR, p. 112)

[2] *"Mitigation measures will become more detailed during the assessment of the LPA in the Final EIS and receive commitments in the Record of Decision. Costs for mitigation of project impacts (including mitigation measures for noise, visual and traffic impacts) are included as part of the Project's capital costs."* (PHR, p. 129)

[3] *" The Dulles Corridor Rapid Transit Project followed FTA noise and vibration methodology appropriate to transit projects. This methodology does not require an assessment of the future No Build noise condition."* (PHR, p. 81)

[4] 40 CFR 1502.14 (Alternatives including proposed action) and 40 CFR 1502.16 (Environmental consequences)

[5] *"...In coordination with VDOT, Fairfax County, Loudoun Count and the Town of Herndon, a determination of the needed improvements will be made for station access beyond the station site plan, as well as the degree that the Project will fund such improvements, and their ownership and maintenance..."* (PHR, p. 111)

[6] *"...Relocation of the Tysons Central 7 Station entrance would result in conflicts with existing development, and with possible future profiles of Route 7 envisioned by VDOT..."* (PHR, p. 146)

[7] *"...WMATA has established a ranking (in descending order) of priorities for access and proximity to a station: pedestrian and bicycle/accessible route..."* (PHR, p. A12)

[8] *"The Final EIS process will identify the needed mitigation measures. These improvements will be programmed by DRPT or VDOT to complete construction by the dates identifies in the Supplemental Draft EIS."* (PHR, p. 86)

"The mitigation measures presented in Table 6.2-7 in Section 6.2.3 are based on the mitigation measures presented in Table 6.2-6 in the Draft EIS. As noted in the Draft EIS, a more detailed discussion of the recommended mitigation and its effects can be found in the Traffic Analysis and Station Access Study (June 2002). A new, detailed traffic analysis will be conducted for the Final

EIS. Mitigation measures will be further developed and revised as necessary. Information presented in the Final EIS document will clearly identify those measures that will be implements as part of the Dulles Corridor project and those that will be implemented by others." (PHR, p. 87)

"...Additional analysis of traffic effects for both the proposed LPA and LPA Phase 1 will be conducted as part of the development of the Final EIS. Mitigation measures for anticipated effects will be identified. The effects at Wiehle Avenue Station under LPA Phase 1 will be an important consideration in the analysis." (PHR, p. 90)

"...Additional analysis of traffic effects for both the LPA and LPA Phase 1 will be conducted as part of the development of the Final EIS. Mitigation measures for anticipated effects will be identified. The effects at Wiehle Avenue Station under LPA Phase 1 will be addressed in this analysis." (PHR, p. 91)

"DRPT, as the project sponsor, will be the contracting authority for the project's implementation and the recipient of Federal and non-federal funds. It will acquire right-of-way, apply for environmental permits and bear responsibility for mitigation commitments..." (PHR, p. 161)

"Several roadway mitigation measures are proposed plus other intersection improvements that will be studied as part of the Final EIS... the Project will invest in measures to mitigate the effects of the additional traffic..." (PHR, A7)

[9] *"Specific to Tysons Corner, the Project Team will develop and administer a business advisory team to provide a forum for affected businesses and communities to participate in the implementation of the Project, particularly the mitigation of the construction effects and maintenance of traffic in Tysons Corner... during the preliminary engineering phase."* (PHR, p. A11)

[10] *"Congestion Management measures will be further refined during preliminary engineering."* (PHR, p. 91)

Northern Virginia District Office of VDOT, in coordination with other appropriate VDOT sections, has reviewed of Dulles Corridor Rapid Transit Project, Supplemental Draft Environmental Impact Statement, Volumes I & II dated October 2003 documents transmitted to the District Office on October 29, 2003. The attached file (DCRTP_SDEIS) contains majority of our comments; however, additional comments may be sent to you by or before the end of the public comment period, December 29, 2003.

<<DCRTP_SDEIS_COMMENTS4.doc>>

VDOT acknowledges and reaffirms its full support for the State's identification of this project as one of the high priority projects for the region. We look forward to continuation of our very successful and well coordinated efforts in improving transportation in Northern Virginia.

Document Comments

Document: Supplemental Draft Environmental Impact Statement -- Dulles Corridor Rapid Transit Project (Virginia Department of Rail and Public Transportation)
Date of Document: October 29, 2003
Date of Comments: December 23, 2003

Page	para.	Line	Comment
S-3; 1-2	3	2-11	*"FTA is considering only the first phase of construction for New Starts funding from the anticipated six-year reauthorization of the New Starts program. FTA may consider the proposed subsequent phase for FTA funding in the future, but has made no commitment to do so. Furthermore, FTA has determined that the first phase now being considered for funding has independent utility even if the subsequent phase is never built. (The first phase serves the high employment area of Tysons Corner.) Therefore, FTA will make a decision on the funding of the first phase without regard to possible future phases."* If construction of Phase 2 is delayed, how will the Project address outstanding Phase 1 issues that will become prolonged and more critical as a result of this delay?
S-11	3		*"Continue refinement of the proposed LPA through coordination with local communities to address outstanding issues related to project design, mitigation, funding, and implementation."* VDOT looks forward to continued coordination with the Project to address these issues.
S-13, 2-20	Table 2.2-2		*Transportation Effects – Number of intersections requiring mitigation as a result of the project.* This table indicates that the number of intersections at LOS F (am or pm) does not change from existing conditions, or gets worse. This information is not shown for the "LPA Phase 1 Opening Year" cell – please include. Also, please include the specific intersections (as listed in traffic mitigation section of SDEIS) and the proposed mitigation measures to address the traffic impacts at these intersections as a result of this project.
2-22	3	8	*"Parking at Tysons West Station would be reduced to 500 spaces and be constructed as part of a joint development project. The specific location and design of the park-and-ride facility is not known at this time, but the anticipated cost of the facility is assumed as part of the Dulles Corridor Rapid Transit Project.* Vehicles accessing the stations would use local roads." Please explain how the traffic impacts of the proposed future 500 space park-and-ride facility and station access will be addressed.
3-18	Table 3.2-1		*Summary of Long-Term Effects to Neighborhoods and Community Facilities.* This table indicates that there is "no change" in effects of T6/Y15 vs. the Full LPA. This section of the report needs to address how increased traffic volume, traffic congestion, and spillover parking will be handled by the Project.
3-20	6	5	*"Proposed mitigation strategies for traffic impacts at Wiehle Avenue include adding turn lanes at intersections, parking management techniques, preferential treatment for rideshares, financial/time incentives, and information and marketing campaigns."* Adding turn lanes at intersections does not seem adequate to address the traffic impacts that will occur as a result of the interim terminal station located at Wiehle Avenue. Also, please provide background analysis as to how these proposed mitigation measures were determined, and identify roadway improvements that would fully address the traffic impacts.

3-38	Table 3.6-1		Effects to Parklands and Recreation – Although there is "no change" in effects from the DEIS, this table indicates that there may be possible impacts to future trails from Tysons East Station, Tysons Central 7 Station, Tysons 7 Station, Tysons Central 123 Station, and Wiehle Avenue Station. Please indicate actions the Project will take to address these possible impacts. It is important to provide non motorized facilities for transit riders to access these stations, particularly in Tysons Corner.
3-45	1	1	*"Increased vehicle traffic at Wiehle Avenue Station may impact future trails proposed in Fairfax County's Countywide Trails Plan (June 2002)."* Please indicate actions the Project will take to address these possible impacts.
6-16	4	2	*"The implementation of the proposed LPA, and, specifically the provision or expansion of park-and-ride and Kiss & Ride facilities, would result in increased traffic on local roadways around stations."* Please indicate in the Final EIS the measures required to mitigate traffic impacts on local roadways around stations and identify which measures will be completed by the Project and which measures will not be part of the Project.
6-18	6	1	*"...the reduction in parking capacity at this station (Tysons West) would result in a considerable decrease in project-related trips at the Tysons West Station for all years. However, this reduction would not necessarily result in significant improvements to traffic impacts, over those presented in the Draft EIS for the Metrorail Alternative (T6/Y15), since the background traffic volumes would remain extremely heavy near the station area..."* Eliminating the formerly proposed large parking structure will result in less impact to the local road network from vehicles anticipated to use the parking structure, than that identified in the DEIS. However, the smaller parking facility will generate additional conflicting (left turn) movements.
6-19	4	1	*"Based on the mode of arrival data presented in Table 6.2-3, the 2025 park-and-ride person-trips that would be generated at the* [Wiehle Avenue] *station under the proposed LPA and proposed LPA Phase 1 are expected to change minimally compared to the Metrorail Alternative. Therefore, it can be assumed that the general traffic impacts expected in the vicinity of the station area would be similar to those documented in the Draft EIS for the Metrorail Alternative T6/Y15)."* During the period when the Wiehle Avenue Station operates as the interim terminus of the LPA Phase 1, traffic patterns will differ substantially from those that can be anticipated when this station becomes an intermediate station. It can be anticipated that more riders will access the transit system at this location, since this will be the most convenient rail access option for potential riders to the west of Wiehle Avenue.
6-19	5	5	*"...traffic volumes generated at the station would increase significantly during the peak hour at the Wiehle Avenue Station entrance for the proposed LPA Phase 1. As a result, levels of service and delay are expected to deteriorate at this station entrance in 2009 and in future years if the full LPA is not constructed. Furthermore, the excessive delay may cause extensive queuing thus making movements from the westbound Dulles Toll Road ramp to the northbound Wiehle Avenue approach difficult."* Since FTA is only considering funding for Phase 1 at this time, please indicate the measures the Project will take to minimize level of service degradation at the station entrance and its vicinity as a result of the Wiehle Avenue Station being the interim terminal station. For example, indicate how the Project will address the possibility of extensive queuing from the eastbound DTR ramp to northbound Wiehle Avenue in the AM and possibly the opposite movement in the PM.
-19	5	8	In the sentence *"...extensive queuing thus making the westbound...,"* the word westbound may be incorrect. Queuing is expected on the eastbound ramp. (see above)

6-19	5	9	*"...the movement from the toll road ramp to Wiehle Ave approach is difficult."* Please investigate bus routing plans that will reduce the impacts on the toll road ramps. An alternative to alleviate traffic congestion associated with the end of the line station for Phase 1 could be to build a direct access ramp to the station to route traffic from the eastbound toll road off-ramp to the station.
6-19	5	9-10	*"The additional traffic entering the station via Isaac Newton Drive would have negligible effect on traffic operations."* Traffic balances itself out and when the traffic is congested on the Wiehle Avenue corridor and the toll road ramps, drivers will use Sunset Hills Road. Therefore, a possible approach to balancing traffic may be to build a right turn only lane on Sunset Hills Road at the entrance to the station.
6-20	4	1	*"With the design modifications, the effects of the proposed LPA would be similar to those presented for the Metrorail Alternative (T6/Y15) in the Draft EIS. However, if the full LPA is not constructed, 2,450 parking spaces would be constructed at the* [Herndon-Monroe] *station by 2025 to accommodate increased demand for transit services in the corridor."* Since FTA is only considering funding Phase I at this time, it is unclear when the need for these spaces would be determined. Please clarify.
6-21	2	1	*"Based on the mode of arrival data presented in Table 6.2-5, the project related traffic effects of the proposed LPA and proposed LPA Phase 1 are anticipated to be significantly less than those presented in the Draft EIS for the Metrorail Alternative (T6/Y15), due to a reduction in parking capacity at the Route 606 Station. However, this reduction would not necessarily result in significant improvements to traffic impacts, over those presented in the Draft EIS for the Metrorail Alternative T6/Y15), since the background traffic volumes would remain extremely heavy near the station area."* Please explain the rationale for reducing parking capacity at this location and consequently, the impacts to roads and other parking facilities along the line.
6-22			The proposed mitigation measures should include parking areas for cabs and drop off and pickup areas for the passengers in the Tysons Corner stations where there are no provisions for kiss and ride lots. If the Project is relying substantially on foot access to the stations, this should be noted.
6-22	6.2.3		The proposed traffic mitigation measures listed do not fully address the impacts on the existing transportation system. Please provide technical analyses that validate and document the completeness of this list.
6-24	5		The Supplemental DEIS states that the implementation of the design changes to the proposed LPA would have no additional effects on the existing and planned bicycle and pedestrian facilities in the Dulles Corridor. Although there would be no additional effects, please indicate how the Project will provide adequate bicycle and pedestrian access to the stations.
6-25	4	10	*"These modifications would require taking some of the I-66 right-of-way."* Please ensure that these plans and agreements are well-coordinated with VDOT, so that current roadway operations and potential future improvements to I-66 are not affected.
6-25			This chapter should include a commitment to develop and implement a Congestion Management Program to operate during the construction of this project, especially in the Tysons Corner and Wiehle Avenue areas.
6-26	2	4	The sentence states that *"Cut-and-cover construction would require lane closures that would disrupt traffic to a considerable extent."* Revise the sentence to read "...off-peak lane closures..."
6-26	3	3	Change the sentence to read "...off-peak lane closures..."
6-26	3		This paragraph mentions the requirement of temporary lane closures. VDOT looks forward to working with the Project on a Congestion Management Program and Maintenance of Traffic Plan.

6-26	3	4	Change the sentence to read "…off-peak lane closures…"
6-27	1	4	*"Those improvements that would occur on the I-66 right-of-way acquired from the Virginia Department of Transportation (VDOT) would not affect current roadway operations or planned roadway improvements."* Please ensure that these plans and agreements are well-coordinated with VDOT, so that current roadway operations and potential future improvements to I-66 are not affected.
10-5	1	1	*"Once the proposed LPA is selected and prior to circulating the Final EIS, every reasonable effort will be made to resolve interagency issues related to the proposed action. If significant issues remain unresolved, these issues, and the consultations and efforts made to resolve the issues, will be documented in the Final EIS."* VDOT looks forward to continued work on these unresolved issues, as well as a Project commitment for mitigation of traffic impacts (maintenance of traffic) and congestion management during construction, and identification and implementation of overall measures to minimize level of service degradation on local roadways.
10-5	3		VDOT looks forward to continued coordination regarding permitting requirements and possible development of a master agreement between VDRPT and VDOT.
			Regarding the potential establishment of an eastern boundary of the Dulles International Airport Historic District, any decision/actions that would lead to minimization of harm to the district should not preclude (or should take into account) any future surface transportation improvements on the DTR/DAAR (Sections 3.5 & 7) for the entire length of the Project.
			The document should reference Fairfax County's development of a watershed management plan for the Difficult Run watershed (Section 4.2)
			The SDEIS does not provide a noise assessment for the No-Build Alternative. (Section 4.7).

Subject: Comments on October 2002, DCRTP Public Hearings Report on DEIS- Docket No. R02-1

Importance: High

Mr. Corey W. Hill
Northern Virginia Regional Manager
Virginia Department of Rail and Public Transportation

The Northern Virginia District Office of the Virginia Department of Transportation (VDOT) has reviewed the October 2002 Public Hearings Report (PHR) for the Draft Environmental Impact Statement and General Plans for the Dulles Corridor Rapid Transit Project (Docket Number R02-1). Thank you for the Dulles Corridor Rapid Transit Project (DCRTP) Team's responses to our comments on the June 2002 DCRTP DEIS package. VDOT reaffirms its full support for the State's identification of this project as a high priority project for the region. We present to you the following comments and suggestions and look forward to continued coordination with the DCRTP Team, with the common goal of improved overall transportation in the region.

Mobility - The DCRTP Team concludes that "each of the rapid transit alternatives will help to increase overall mobility in the corridor, the counties, and the region..." and will "increase overall transportation capacity and person throughput in the corridor." (p. 42) and states that the DCRT "Project would not resolve traffic gridlock, however, it would provide an alternative to driving the automobile." (p. 271).

To maximize overall mobility, it is critical that the current capacity of the road network be at least maintained and that careful consideration be given by the Team, VDOT and the counties to not precluding any potential future road improvements. We agree with the need for the Team to continue detailed coordination with VDOT, Metropolitan Washington Airports Authority (MWAA) and the counties, to insure that the proposed rail line and the road network collocate as follows:

a. Maintenance of Traffic -The PHR indicates that "As stated on page 6-62 of the Draft EIS, maintenance of traffic plans would be developed for all construction activities that would impact regional and local roadways." To the extent possible, all construction requiring lane closures would be done at night, on weekends, or in the off-peak period." (p. 330). VDOT looks forward to working with the Team and reviewing the Project's Maintenance of Traffic Plans in detail. In general, the number of lanes along corridors can not be reduced during construction except during nights or weekends. Congestion Mitigation Plans will need to be developed and coordinated with VDOT to insure project constructibility.

b. Current capacity of existing road network - VDOT understands that the DCRT Project will replace existing roadway capacity where this is affected by the Project, by relocating or otherwise modifying road elements where necessary, in consultation and coordination with VDOT and the counties.

c. Potential future road improvements - VDOT fully supports continuing, with full participation of transportation staff from Fairfax and Loudoun Counties as well as MWAA, a combined coordination effort with the DCRTP Team to insure that rail and highway elements can collocate now and not to preclude potential future road improvements. With respect to

possible future road improvements, it should again be noted that, where the DEIS and the PHR mention or list planned roadway improvements, specific citations to the official document(s) should be made: the approved Six Year Program, the Transportation Improvement Program (TIP), the Constrained Long Range Plan (CLRP), and the County Comprehensive Plans. Please refrain from using general comments about "VDOT is planning to construct/widen, etc" that may be based on concepts developed in coordination with County staff, based on Comprehensive Plans, but lack programming or funding commitments from any agency or entity at this time. Such statements may give the false impression of imminent, approved or funded projects (e.g. pages 266, 270).

Utilities - Consideration should be given in the early stages to "utility corridors" when utility relocations are required for the DCRT project. Future impacts and costs will be reduced if the utilities are not required to be relocated again as any planned improvement in the areas is initiated.

Programming of Improvements by VDOT - Reference has been made in the he June 2002 DEIS and Section 4(f) Evaluation report, "Table 6.2-6: Summary of Traffic Issues and Proposed Mitigation Measures" and identifies VDOT as the "responsible agency", (Volume I, on pg. 6.34-5). Naming VDOT as the responsible agency needs to deleted; the measures identified are mitigation measures for features / impacts of the DCRT Project, as indicated on page 6-32: "...but merely improvements that could be employed at each intersection to alleviate future traffic impact from the project" and their costs are part of that Project. These mitigation measures are not projects that VDOT has programmed or funded. When requested, VDOT will evaluate the proposed mitigation measures, in conjunction with the Congestion Mitigation Plans (which will include further analysis of required improvements, their impacts, feasibility and cost estimates).

Transit-related development - The DCRT Team includes several statements about the transit-related development, consequent increased traffic and need for careful and timely decisions to mitigate impacts. DCRT team responses and PHR page references are included below:

- "Overall, though the transit-related growth associated with mass transit implementation will result in increased development and increased traffic congestion in station areas, this change is consistent with local goals and comprehensive plans." (p. 43)
- "Actual implementation of transit-oriented development and the timing and increase in densities is under the jurisdiction of the local government in the area, so any mitigation needed to support the increase in densities is also under the jurisdiction of the local government, and they have included measures in their land use regulations." (p. 275, 384, etc.)

VDOT looks forward to continued coordination with the counties on decisions about the impact of proposed developments per their Comprehensive Plans and any related future roadway improvements. Collectively, our detailed review of individual transit-development applications will be critical as the counties work to seek balance between level of development, mitigation measures and timing of future roadway improvements.

Coordination required before April 2003 Final EIS submission to FTA - The DCRT Team has stated that, should there be changes to the Project as the result of the determination of mitigation measures and of continuing coordination, the Team will seek approval of amendment to the General Plans. Following is a sampling of the issues that we see will need detailed coordination with VDOT, MWAA and the appropriate County staff:

- Maintenance of Traffic during construction (including Congestion Management Plans).

- Design and programming (including more in depth assessment of traffic volumes and patterns, access, constructibility) of related roadway improvements. An example is the proposed Route 7/Tyco Road 2,000 car parking facility.

- Assessment of impact and planning for mitigation and/or possible future improvements at various locations in Tysons, Reston, Herndon, Dulles National Airport and Eastern Loudoun County.

- On-street feeder bus bays for Tysons Central A, B and C stations (p. 274).

Thank you again for this opportunity for VDOT to provide comments and participate in this important project. Please let me know if I can be of further assistance.

Subject:	DCRTP - Draft environmental Impact Statement, June 2002- Technical Review Comments
Importance:	High

Air Quality Comments.tif

Mr. Corey W. Hill
Northern Virginia Regional Manager
Virginia Department of Rail and Public Transportation

Northern Virginia District Office of VDOT, in coordination with other appropriate VDOT divisions, has conducted a review of the following documents transmitted to the District Office on June 27, 2002:

* Draft Environmental Impact Statement
* General Plans, Line and Systems
* General Plans, Facilities
* Technical Reports

VDOT acknowledges and reaffirms its full support for the State's identification of this project as one of the high priority projects for the region. I present to you the following comments and suggestions and look forward to continuation of our very successful and well coordinated efforts in improving transportation in Northern Virginia.

Traffic Analysis and Station Access Study - Technical Report (June 2002)

* Pg. 13, item 2.2, BRT Alternative:2nd paragraph states: "BRT stops would be located at facilities outside the median [of the DAAR]", and "BRT vehicles would provide access to stops by leaving the DAAR or the Greenway". Examples or descriptions of the BRT stops would be very helpful for the reader to better understand the difference between BRT stations and BRT stops.

* Section 3.3, Pg. 22, 2nd full paragraph - The report states that volumes for the various ramps proposed by VDOT to access Route 7 and 123 expressways from the local roads were necessary to complete the balancing process, and that these were obtained from the Tysons Corner Route 7 and Route 123 Transportation Collocation Study (Collocation Study), State Project Number TPD 11671-2-01, dated April 3. It should be noted that the Draft Collocation Study report was conducted within a compressed 3-month schedule. As stated in Chapter VI of the Collocation Study, traffic growth was based on a previous report (June 2000 Route 7/123 Corridor Study) and on several assumptions. It is hoped that any traffic volumes used in the DCRTP study included an understanding of the Collocation Study's context and limitations, and a verification of the assumptions used. We recommend that both the Traffic Analysis and Station Access Study and the Travel Demand Forecasting Methodology reports include a description of: the assumptions and how they were verified or modified as appropriate; and how the resulting volumes were determined to be consistent with the overall forecasting effort

conducted specifically for the DEIS.

* Section 6.3, pg. 134, Table 6-2 - Footnote 1 states that "Direction not specified by VDOT " yet numbers refer to Dulles Toll Road eastbound. Note 2 refers to Route 50, yet Footnote 2 refers to HOV lane on I-495. It appears that the text of the footnotes was changed between the 95% Review Draft and this latest (June 02) report, but the corresponding notes on the table were not revised. Footnote 1 in the 95% Review Draft referred to "Volumes exclude high occupancy vehicle lanes; no direct comparison to year 2000 can be made" (please note that by year 2000 (base year in table), HOV lanes were already in place and, for the DTR, volumes are available by lane.

* Chapters 9 through 17:
The proposed interchanges at 7/West Park-Gosnell and 123/International are not identified in the CLRP. Although an interchange at an isolated location does not need to be called-out from an air quality conformity standpoint, a series of interchanges in close proximity to one another could change the functional classification (for modeling) of the road from arterial to freeway (which would have to be accounted for in the model).
* Monroe St/Van Buren in the town of Herndon are not identified for improvement in the adopted FY-01 TIP / CLRP. East Elden St. is identified in the adopted FY-01 TIP / CLRP as reconstructed as a 4-lane section between Monroe St. and the Herndon Parkway East and widened to 6 lanes between the Herndon Parkway East and the Fairfax Co. Parkway. Both widening and reconstruction have a completion date of 2005.
* It is suggested that, when discussing the Planned Roadway Improvements, the DCRTP DEIS report make specific reference to their source official documents: the Six Year Program, the Transportation Improvement Program (TIP) and the Constrained Long Range Plan (CLRP), and the Fairfax County Comprehensive Plan. Please refrain from using statements about "VDOT's decisions" that are not backed up by the approved Six Year Program. For projects beyond the Six Year Program time horizon, reference should be made to the source document (TIP, CLRP as appropriate), noting that these documents are the result of cooperative efforts of multiple agencies at various levels (federal, state, local) and subject to public review. Please remove all references to VDOT deciding that specific interchange and road widening projects (Route 7 and Route 123) are "high priority" (e.g. section 10.1 on pg. 173, section 11.1 on pg. 187, section 12.1 on pg. 203, section 14.1 on page 233). Prioritization is typically a result of coordinated evaluation with input from Fairfax County, and in accordance with Fairfax County's Comprehensive Plan. Perhaps the consultant is making inferences from preliminary or final VDOT-funded consultant reports such as the 6/00 Transportation Corridor Study by PHR&A, or the 2/5/02 Tysons Corner Selected Improvement Compatibility Study by PTG. It should be noted that although these reports are used by VDOT as tools for analysis/coordination, their recommendations do not necessarily imply VDOT's concurrence.

* Existing traffic volumes appear low. For example the intersection of Route 123 at Tysons Boulevard indicates 90 vehicles during the a.m. peak and 62 vehicles during p.m. peak making left turns from southbound Tysons Boulevard onto eastbound Route 123. A recent traffic study done in the same area indicates that the existing a.m. left turn (same as above) as 392 vehicles and 1845 vehicles during the p.m. peak. All numbers need to be checked properly and appropriate numbers used as a starting base.

* The County has the nondegredation policy in place it is unclear as to how the increased development is planned to be mitigated. Also how is all the planned future higher densities addressed in the study? Are they included in the overall growth rate?

* Pg. 19 - Highway impacts are not analyzed in detail, only very generic information is presented in the document. No supporting data/analysis were provided. Statement is made that there are Synchro, HCM, Signal2000 and Transyt-7F files available for review but they were not included in the package. All the files in a electronic format as well as

paper copies need to be provided for the Department's thorough review. The report includes summary findings that are very generic in nature. Highway corridor impacts need to be addressed.

* Accident data and analysis are very generic and does not include the details needed. Specific attention needs to be given to address the pedestrian safety concerns.

Travel Demand Forecasting Methodology and Results & Travel Demand Forecasting Methodology and Results Appendix - Technical Report (June 2002)

* An executive summary as previously suggested, is highly recommended. This summary ought to include information such as transit modal split, LOV and HOV for both with and without Transit (i.e. Tyson or Herndon to DC). It is unclear what are some of the critical assumptions and data sources used.

* Screen-line volumes for the forecasted years under all alternatives, including no-built should be included.

* It is very difficult to assess whether Highway LOS for the corridor has been addressed. It would be helpful to include Highway LOS for both with and without transit improvements and increase land use density, in order to evaluate highway impact and related mitigation measures identified. "Dulles Corridor Transit Trip Summary, 2025 Alternative T4, Home Based Work Person Trips" Table (in the Appendix I, no page # , no table #) shows 64.6% transit share from Tyson to DC Core. In this case, please show the impact on the highway LOS.

Transit Operations and Maintenance Plan - Technical Report (June 2002)

* Page 28 - Shows the summary of dead head calculations. The Metro rail Service and inspection yard sites are listed in column 1 but not show in the report. Please include a map showing these potential locations for the Metro rail Service and inspection yard sites.

* Page 29 - Table 3-8 Some of the columns heading show units and others particularly the distance column does not show any units. Please check all the tables to include the units for columns.

* Chapters 1 &2 - Header on most of the pages incorrectly displays Index of Figures in the upper right hand corner on most of the pages.

* Page 23 - 2nd paragraph second line should read New Carrollton would be replaced instead of New Carrollton would replaced.

Land Use and Socioeconomic - Technical Report (June 2002)

* Page 7 - PURPOSE - "By providing a high-capacity transportation choice for travelers, the proposed project would be better able to meet the anticipated increases in travel demand, reduce the projected use of existing facilities, and help reduce further congestion in the corridor."

This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and the anticipated benefits are lost.

"Moreover, the ability of the proposed improvements to increase person-moving capacity over long distances with fewer numbers of vehicles,

should help minimize future increases in vehicle miles traveled in the corridor and vehicle emissions."

This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and the anticipated benefits are lost. In addition, because the proposed improvements only provide for increased transit opportunities in only the east-west directions, the increased travel demand in the north-south directions due to the increased densities is not even partially reduced by the proposed construction, again reducing the anticipated benefits.

* Page 8 - TABLE 1-1: GOALS AND OBJECTIVES "Goal 4 - Support Environmental Quality"- The many objectives listed under this goal would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and the anticipated benefits are lost. In addition, because the proposed improvements only provide for increased transit opportunities in only the east-west directions, the increased travel demand in the north-south directions due to the increased densities is not even partially reduced by the proposed construction, again reducing the anticipated benefits.

* Page 188 - Table 4-8- SUMMARY OF COMMUNITY IMPACTS OF METRORAIL ALTERNATIVE
"Access Changes - T1, T6, T9, and T4
.. congestion affects two neighborhoods . . ."

This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and congestion will increase throughout the corridor and beyond.

"Property Values - T1, T6, T9, and T4
Increase at station areas"

The comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities. While this may still result in increased property values at station areas, the increase in congestion throughout the corridor may result in a decrease in property values in other areas.

Economics and Secondary Development Effects- Technical Report (June 2002)

* Page 5 - Need - "The projected increase in residents and job opportunities, will result in markedly higher traffic volumes on highways and streets in the Dulles Corridor and throughout the region."
*
* "Given that the corridor transportation network currently experiences traffic volumes that meet or exceed the capacity of roadways and intersections, causing severe congestion, these increases in traffic volumes are only expected to worsen conditions."
*
* "Because the existing transit system in the Dulles Corridor

operates on the congested roadways described above, it generally offers a poor alternative to auto travel."

* While these are valid considerations, there is no information as to how this impact will be mitigated other than a mention of the increase in rail transit opportunities with the Metro rail Alternative. While it is recognized that rail would provide some mitigation for congested auto travel in the east-west direction, in this instance the increase in land use densities allowed with the provision of rail transit would result in an increase in traffic that is greater than any reduction that which might be provided by rail patronage. Additionally, it should be anticipated that there will be no reduction in congestion, but an increase in congestion, in the north-south direction.

* Page 28 - Tax Revenue Effects - "Construction of the Build Alternatives will require the purchase of some private land and/or structures for easement, rights-of-way, parking and station facilities, thereby removing these properties from the existing local tax base."

* Should any necessary lands be obtained through a process that would allow for density transfers, which is often the case; there would be no loss of tax revenue. In addition, under this process there may be no cost for acquisition.

* Page 105 - Secondary Effects Related to Density Increases - "The allowable transit-related growth will result in an increase in development in the immediate vicinity of stations throughout the corridor, but does not represent a dramatic increase over the overall level of growth allowed in Fairfax and Loudoun counties"

* As this is already a congested corridor, "an increase of approximately 38 million of 43 million square feet of development over the Baseline Alternative (Page 112)" with associated increase in work vehicle trips of "20,000 per day" (Page 114) and increase of non-commute vehicle trips of "55,000 per day" (Page 114), does pose a significant threat for increased delays.

* "transit related growth allowed in Loudoun County was not included (in) the supplemental transportation demand analysis."

* One proposal in Loudoun County calls for the development of some 19 million square feet of office space alone at the Route 772 Station. No resultant impacts of such development on the Metro rail system, the surrounding roadways, and the corridor in general are provided in the report.

* "Even without mobility benefits associated with the provision of rapid transit improvements, the corridor is projected to absorb high level of development under the Baseline Alternative."

* While it may be possible to physically add all this new development under the Baseline Alternative, it does not seem reasonable to assume that it would actually be built with the higher traffic congestion that would result from such development.

*

* Page 125 - MITIGATION - The mitigation strategies contained in the report speak mainly to the opportunity of the local jurisdictions to limit development in the area of the transit stations if undue congestion is experienced in the area. The report does not look at the impacts to roadways running in a north-south direction or otherwise outside the corridor. As indicated, these roadways would also be affected by the increase in density at the transit locations.

<<Air Quality Comments.tif>>

Cultural Resources Technical Report - (June 2002)

* As stated in previous comments, this study has not established which resources previously identified are in fact eligible for the National Register. This is a fundamental flaw.... There are clearly a number of resources previously documented within the APE (for example Bois de Gosses, Shiloh Baptist Church, Plantation, Wiehle/Sunset Historic District, etc) that have not been evaluated by the FTA or VDHR. Comments on eligibility for each resource need to be obtained from VDHR.

* Without knowing which resources are eligible for listing in the National Register, an effect determination cannot be made.

* Without knowing which resources are eligible and what their boundaries are, Section 4(f) evaluations cannot be made.

* If documentation is provided by the FTA (or their consultants) to VDHR, several of the resources may well drop from consideration in the context of Section 106. There appear to be very few resources that will be eligible for listing in the National Register.

* The report states on page 111, that additional architectural resources may exist beyond those previously documented. This is a potentially fatal flaw in the study... if there are other eligible historic properties they need to be identified now. Their location may well effect a location decision (via Section 4(f)).

* Page 111 - Archaeological survey needs should be depicted on maps.

Hazardous Contamination Materials Technical Report (June 2002)

* No additional comment since the review comments of the 95% Draft EIS, on 3/10/02

Natural Resources Technical Report (June 2002)

* The 95% Draft EIS Technical Report was reviewed and deemed to adequately address Natural Resources issues. Since the Final Draft Technical Report appears to be essentially unchanged, we have no further comments on this section of the report.

Noise and Vibration Technical Report (June 2002)

* Table 3-13 - Several office, restaurant and retail establishments are incorrectly classified as FTA Land Use Category 3 sites. These and similar commercial and industrial properties are not considered noise-sensitive according to FTA.

* The term "Baseline Alternative" as used throughout the report should be more appropriately termed the "No-Build Alternative." While FTA does not specifically require a noise assessment for the future No-Build Alternative, it is appropriate to provide such an assessment where significant changes in the noise environment are anticipated due to factors unrelated to the project. Typically, the No-Build conditions are similar to the existing conditions such that no assessment is needed. However, the No-Build case needs to be addressed in the EIS and thus it is of interest to know if impacts are expected without the project. Such information can be useful in determining if mitigation for the build alternatives is reasonable and feasible.

* The first sentence on page 93 incorrectly states, "While vibration criteria are generally used to assess annoyance from transit sources at the

exterior façade of receptors, ground-borne noise, or the rumbling sound due to vibration room surfaces, is typically assessed indoors." In fact, both ground-borne vibration and noise effects are assessed indoors.

* Section 4.8.2 should be more specific with regard to the locations and proposed methods for mitigating vibration impacts from Metro rail operations. In addition to the potential measures listed, the use of spring rail or moveable point frogs at crossover locations should also be considered.

* Reference section 5.0 does not make mention of the VDOT Noise Abatement Policy.

Visual and Aesthetic Resources Technical Report (June 2002)

* No additional comment since the review comments of the 95% Draft EIS, on 3/10/02

Dulles Corridor Rapid Transit Project DEIS and Section 4(f) Evaluation, Vol. I - (June 2002)

* Pg. S-27, 4th paragraph. (Summary, Environmental Effects) - Next to the discussion for secondary effects of increased development at transit stations, the sidebar comments (right margin) states one of the potential positive effects as being "Reduction in traffic congestion". By itself this statement appears counter-intuitive (you would expect more traffic congestion caused by increased development, as only a portion of new trips are captured by transit). Suggest the margin comment be further explained, such as by "Potential positive effects of concentrated vs. more spread out development".

* Pg. 2-13 - The adopted FY-01 TIP / CLRP specifically identifies the following projects in the Route 28 Corridor between I-66 and VA 7:

Partial interchange at Barnsfield Road, open to traffic in 2003
VA 606 Interchange, open to traffic in 2005
VA 625 Interchange, open to traffic in 2005
VA 606 Interchange, open to traffic in 2005
Westfields Road Interchange, open to traffic in 2006
McLearen Road Interchange, open to traffic in 2006
Innovation Avenue Interchange, open to traffic in 2006
Study widening to 8 lanes and upgrading to a freeway between I-66 and the Dulles Toll Road, study to be completed by 2020
Study upgrading to a freeway between the Dulles Toll Road and VA 7, study to be completed by 2020

The draft FY-03 TIP / CLRP specifically identifies the following projects in the Route 28 Corridor between I-66 and VA 7:

Partial interchange at Barnsfield Road, open to traffic in 2003
VA 606 Interchange, open to traffic in 2007
VA 625 Interchange, open to traffic in 2005
Upgrade VA 28 to a freeway (construct interchanges / eliminate at-grade access points) and widen to eight lanes between I-66 and VA 7, open to traffic in 2015. Interchanges and widening could occur in the 2006 to 2015 time frame with all improvements open to traffic by 2015.

* Planned Roadway Improvements - It is suggested that, when discussing Planned Roadway Improvements, the DCRTP DEIS report make specific reference to their source official document(s): the Six Year Program, the Transportation Improvement Program (TIP) and the Constrained Long Range Plan (CLRP), and the Fairfax County Comprehensive Plan. Please refrain from

using statements about "VDOT's decisions" that are not backed up by the approved Six Year Program or referred to in official correspondence. For projects beyond the Six Year Program time horizon, reference should be made to the source document: TIP, CLRP as appropriate (noting that these documents are the result of cooperative efforts of multiple agencies at various levels --federal, state, local -- and subject to public review), and/or the Fairfax County Comprehensive Plan. Example planned improvements that need source clarification:

- Pg. 2-13. To statements that Route 7 /Route 123 within Tysons Corner are planned for expansion to 8/ 6-8 lanes by 2010
- Pg. 6.6, 2nd to last paragraph: "VDOT is planning several major roadway improvements along Routes 7 and 123 in Tysons Corner.... widening of Routes 7 and 123, and the construction of grade-separated interchanges at Route 7 / Westpark Drive, Route 7/ International Drive, and Route 123/ International Drive... by 2010." (Recall 8/4/00 letter by Tom Farley, included in report's Appendix, asking that the team consider and evaluate the improvements planned by 2010 that are included in the Fairfax County Comprehensive Plan and the regionally adopted Constrained Long Range Plan (CLRP).

* Pg. 3-11, Fig. 3.1-2 - Proposed Land Use in the Corridor: Map and insert identify major roads (Dulles Toll Road, Beltway) as Open Space. Suggest additional label in the legend.

* Pg. 6.53: Table 6.3-11 - suggest adding "Corridor Transit" to beginning of title

* Pg. 8-3 : Table 8.2-2 - suggest adding: in $ million

* Pg. 11.16. - Dulles Corridor Steering Committee is "composed of the executives from each of the project's funding partners". Suggest adding that the committee is chaired by a member of Virginia's Commonwealth Transportation Board (CTB), representing VDOT and VDRPT.

Dulles Corridor Rapid Transit Project DEIS and Section 4(f) Evaluation, Vol. II - (June 2002)

* No Comment.

General Plans, Facilities, Vol. III (June 2002)

* Site Plans for the Route 772 Stop indicate North and South of Dulles Greenway alternatives with Proposed Transit Connector Roads to be constructed by others. There is considerable cost in these roadway improvements particularly the bridge crossing Dulles Green Way. The agency charged with building these roads would need to program and fund these commitments and look at the cost verse area of service/ease of service vs. roadway network serviceability. For example the North Station Facility option could connect to Route 643 with traffic routing to Route 772 interchange avoiding the expensive bridge crossing of Dulles Green Way. This would also effect development / access to the areas of stations.

* Station at Route 28 Stop has a proposed overpass by others shown with no tie into North Green Drive. Given that this road bisects the development and parking of the South Station and will profoundly affect entrance to North Station, there needs to be an agreement by builder of over pass prior to the construction of these stations and the dedication of right of way.

* Sheet 690 - Does pedestrian bridge have adequate clearance over the Herndon Monroe Park and Ride Ramp from Structure?

* Reston Parkway Stop - Shows proposed underpass by others directly conflicting with station- By who? Is it part of regional network? Does

this station preclude overhead crossing over of roadway?

* Sheet 774, Tysons West Station - The frontage Road between West wood Center Drive and Spring Hill Road needs to be available for the frontage road system.

Sheet 796- Do the Pedestrian Tunnels conflict with a depressed Route 7 that would be needed with 7/123 Interchange modifications per the collocation study?

General Plans, Line and Systems, Vol. IV - (June 2002)

* Dulles Green Way was recently widened to 6 lanes from Mainline Barrier Toll Plaza to Route 659. This generally leaves a median of 40' beyond shoulder (20' each side). Rail plans should update base as some locations may require more extensive roadway work.

* SWM ponds may require access for maintenance- show how this is to occur. Also these are regarded as hazards to be protected by guardrail-If joint pond, the pond will need to meet state or county design standards as appropriate.

* Review guard rail / barrier requirements beyond normal roadway warrants if a vehicle striking obstruction would result in hazard or result in collateral hazard to road or rail if hit. IE would damage to facility cause further injury or lose of life (power stations/control facilities).

* Limited access facilities have special requirements that must be met even for the infrequent access to maintain ponds/power stations. If access can be reasonably or economically provided from other than the limited access facility this is recommended.

* All structures including columns should be of adequate design, location and depth so that planned / future interchanges shall not have to replace, reinforce or underpin these structures.

* In general, structures/column placement at intersections should be placed to meet sight distance requirements for streets, side road and entrances.

Comments below apply to most sheets in a series but have been identified at sheet first encountered.

* Sheet 015 L1 Alignment- Cross over location at 1910+00 is pushing curve out at sta. 1900+00 and will require significant roadway work due to overlap. Can this cross over location be shifted?

* Sheet 103 Sta. 1869+00 Most of gore as loop meets EB Dulles Greenway will need to be reconstructed. Match line likely further back.

* Sheet 019 Sta. 1820+00 1815+00 Can curve be made shallower (increase radius) shifting rail station 1810+00 slightly South East to avoid reconstruction of WB Dulles Greenway.

* Sheet 026/30 - Stat 1782+00 has a possible SWM pond located in off ramp gore. This would be an un-ideal location as potential hazard to vehicles leaving the road. Would alternate site be available to the southeast of the ramp or further north?

* Sheet 30- what is clearance from rail structure to shoulders may require roadway widening (bow out) as 6th lane continues in this area The relatively flat skew at 1757+00 will require a relatively large span bridge does vertical alignment allow for required structural depth and clearance over roadway?

* Sheet 42-Sta 1480+00 SWM pond widened-evaluate need if further guard rail is required due to proximity of hazard to road. Provide access from Worldgate Dr.

* Sheet 43- Will pedestrian bridge have adequate clearance over Herndon Park and Ride Ramp Structure?

* Sheet 43/44 - Sta. 1440+00 skew of station results need to rebuild EB DAAR- Can different skew or shallower curve/transit be used to stay within existing DAAR bubble and lessen impacts?

* Sheet 44 - Extend guardrail along ramp to protect TBS/RTC

* Sheet 50 - 1275+00 SWM/BMP protect with guard rail- how will it be accessed or maintained? 1260+00 SWM/BMP will it be maintained / accessed from Sunset Hills?

* Sheet 51 Sta. 1232+00 SW quadrants SWM pond- Coordinate will VDOT Hunter Mill Road Project. May result in joint pond within Loop.

* Sheet 56- Sta. 1090+00 to 1080+00 drafting issue show the rail alignment within the median. If shoulder really needed to be rebuilt, indicate on other plans.

* Sheet 57- Configure SWM pond sta. 1061+00 to avoid rebuilding shoulder and guardrail on WB DTR

* Sheet 58- Sta. 1030+00 structure is spanning loop ramp, a more relaxed curve could allow column placement in area between DTR/outer ramp and loop. This would also pull column out of gore Sta. 1026+00 where it presents a hazard. This might only be achievable if cross over location is moved.

* For Tysons Corner area please incorporate comments made during collocation study.

* Sht. 059 Frontage Road should be maintained between Westwood and Spring Hill Road. Ramp or CD road may some day tie into frontage road system.

* Sht. 060 at Sta. 980+00 Verify that frontage road lane shift at portal meet min. standard.

* Sht. 061 Sta. 946+00 Verify that underground rail (any alternative) is below any interchange configuration with International Drive below Chainbridge Road with Chainbridge Road at present day elevation.

* Sht. 64 Sta. 880+00 - Can curve be modified to avoid column near ramp gore or in Rte. 123 shoulder? Possibly shift to North side of 123.

* Sht. 78 Sta. 980+00 - Ensure TPSS 5 is sufficiently below grade so that interchange configurations shown in Tysons collocation study are not effected or impacted.

* Sht. 79 Station 969+00 - Is blocked out area offset to not impact Route 123/7 configurations shown in Tyson's Co-location study. Move EA out of loop ramp.

* Sht. 82 - See comments for sht. 58

* Sht. 85 - Ensure rail structure is sufficiently below grade to not impact Interchange at Rte. 123/International Drive if Chain Bridge Road is maintained at present grade. This may be a more stringent requirement than shown in the Collocation Study. Any lack of clearance should be resolved prior to any construction.

* Sht. 87 - Is Old Spring House Road being realigned or modified?

* Sht. 88 - See comments for Sht. 64

* Over all "T-9 Design Option" with adequate vertical clearances is the alignment that impacts existing and potential future highway improvements the least, while meeting railway over all objectives.

Thank you for providing this opportunity for VDOT to provide comments on this very important project. Please let me know if I could be of any further assistance.

4.0 REGULATORY SETTING

This section describes the applicable statutes and regulations that govern air quality in the project study area at both the federal and state levels and describe the procedures necessary to demonstrate compliance.

4.1 STATUTES AND REGULATIONS AFFECTING AIR QUALITY

Public awareness of the effects of air pollution has increased noticeably in recent years. This concern resulted in the passage of the *Federal Clean Air Act of 1970*, as amended in 1977 and 1990. These statutes are the basis for most federal air pollution control programs. The *Virginia State Implementation Plan* (SIP), developed under the *Clean Air Act*, as amended, contains the major Commonwealth-level requirements with respect to the project.

The EPA under the Clean Air Act regulates air quality nationally. The EPA delegates authority to the Virginia Department of Environmental Quality (DEQ) for monitoring and enforcing air quality regulations in the Commonwealth of Virginia. DEQ is responsible for preparing the SIP and submitting it to EPA for approval. DEQ also works with local and regional agencies that have air quality responsibilities.

The study area is within the area covered by the Metropolitan Washington Council of Governments (MWCOG), which has air quality responsibilities related to transportation and air quality planning in the Washington Metropolitan Region. MWCOG develops the region's transportation and air quality strategies as well as specific programs to reduce emissions, and the strategies and programs developed become part of the Virginia SIP.

4.2 AMBIENT AIR QUALITY STANDARDS

Under the authority of the *Clean Air Act*, EPA established a set of *National Ambient Air Quality Standards* (NAAQS) for seven major "criteria" air pollutants (40 CFR 50). These pollutants are: CO, NO_2, O_3, $PM_{2.5}$, PM_{10}, SO_x, and Pb. New NAAQS for O_3 and $PM_{2.5}$ were passed into law on July 16, 1997 (Federal Register Notice July 18, 1997, effective date September 16, 1997).

The standards are intended to protect the public health and welfare. Primary NAAQS are established at levels intended to protect the public health, including sensitive population groups, with an adequate margin of safety. Secondary NAAQS are set at levels designed to protect the public welfare by accounting for the effects of air pollution on vegetation, soil, materials, and other aspects of the general welfare. States can develop ambient air quality standards provided that they are at least as stringent as the National standards. Table 4-1 presents the NAAQS and the *Virginia Ambient Air Quality Standards* (9 VAC 5, Chapter 30), which are identical.

Compliance with these standards must be achieved by any project to be constructed in the Commonwealth of Virginia.

TABLE 4-1: NATIONAL AND STATE AMBIENT AIR QUALITY STANDARDS

Pollutant	Standard Type	Averaging Period	Standard Value[a]
Carbon Monoxide	Primary and Secondary[b]	8-Hour average	9 ppm (10 mg/m^3)[c,d]
	Primary and Secondary[b]	1-Hour average	35 ppm (40 mg/m^3)
Nitrogen Dioxide	Primary and Secondary	Annual arithmetic mean	0.053 ppm (100 µg/m^3)[e]
Ozone	Primary and Secondary	1-Hour average	0.12 ppm (235 µg/m^3)[f]
Respirable Particulates (PM10)	Primary and Secondary	Annual arithmetic mean	50 µg/m^3[g]
	Primary and Secondary	24-Hour average	150 µg/m^3[g]
Lead (Pb)	Primary and Secondary	Quarterly mean	1.5 µg/m^3
Sulfur Dioxide (SO_2)	Primary	Annual arithmetic mean	(0.03 ppm) 80 µg/m^3
	Primary	24-Hour average[h]	(0.14 ppm) 365 µg/m^3
	Secondary	3-Hour Average	(0.5 ppm) 1300 µg/m^3

NOTES:

a Short-term standards (1 to 24 hours) are not to be exceeded more than once per calendar year.

b Former national secondary standards for carbon monoxide have been repealed.

c ppm: parts per million.

d mg/m^3: milligrams per cubic meter.

e µg/m^3: micrograms per cubic meter.

f Maximum daily 1-hour average. The ozone standard is attained when the expected number of days with maximum hourly average concentrations above the value of the standard, averaged over a three-year period, is less than or equal to one.

g The PM10 standard is attained when the expected number of days with maximum hourly average concentrations above the value of the standard, averaged over a three-year period, is less than or equal to one.

h National standards are block averages rather than moving averages.

Sources: National - 40 CFR 50. Virginia - 9 VAC 5, Chapter 30.

4.3 ATTAINMENT STATUS AND STATE IMPLEMENTATION PLAN REQUIREMENTS

In addition to the standards described above, the *Clean Air Act* specifies geographic areas of the country, which have measured pollutant concentrations that exceed the levels prescribed by the air quality standards (non-attainment areas). It classifies non-attainment areas and specifies compliance deadlines for these areas.

The project is located in Fairfax and Loudoun counties, which are located in the Metropolitan Washington, D.C.-MD-VA Non-attainment Area. EPA has classified this area as attainment for all pollutants except ground-level ozone. With respect to ozone, the EPA designated the Metropolitan Washington D.C.-MD-VA Non-attainment Area, including Fairfax and Loudoun counties, as a [illegible] non-attainment area under the Clean Air Act. The ozone non-attainment area must demonstrate attainment with the ozone standards by 2005. EPA provided the region an extension of time to 2005, due to the effects of ozone transport.

In compliance with the mandates of the *Clean Air Act*, DEQ has developed a SIP for air pollution ntrol. The SIP defines the process by which the ozone NAAQS will be attained, and defines control strategies and schedule that the Commonwealth will employ to reduce emissions in order to reach attainment. To comply with the SIP, a proposed project must not result in any new violations of the NAAQS or *Virginia Ambient Air Quality Standards*, must not exacerbate any existing violations, and must meet the conditions of the conformity regulations.

4.4 CONFORMITY WITH THE VIRGINIA SIP

Under the Clean Air Act, it is the responsibility of federal agencies, such as the FTA, to ensure that a proposed project conforms to the SIP. Because the study area is located in an ozone non-attainment area, a conformity determination is required under Section 176(c) of the Clean Air Act.

EPA has issued two separate regulations for demonstrating conformity of Federal actions in non-attainment areas to the SIP. These regulations are the *Transportation Conformity Rule* and the *General Conformity Rule*. The *Transportation Conformity Rule* (40 CFR Part 93 Subpart A) applies to all transit projects developed, funded, or approved by FTA under the *Federal Transit Act*, including the Dulles Corridor Rapid Transit Project. The Commonwealth of Virginia has established transportation conformity regulations (9 VAC 5 Chapter 150) that are similar to the Federal conformity rules.

The transportation conformity process applies to the Dulles Corridor Rapid Transit Project because FTA will fund the project. Under the *Transportation Conformity Rule*, if a project is not included in the area's Transportation Plan or Transportation Improvement Program (TIP), then emissions inventory (mesoscale or regional emissions burden) analysis must be performed demonstrate conformity. The emissions inventory must demonstrate that the regional emissions with the Build Alternative [redacted]. On the other hand, if a project is included in the area's Transportation Plan or TIP, and if FTA and EPA have approved this plan or program as conforming to the SIP, then the project is presumed to conform, [redacted]

Stay below prescribed regional air quality limits.

Delete ?

The Transportation Plan for the region is the *Financially Constrained Long Range Plan* (National Capital Region Transportation Planning Board, amended November 15, 2000) prepared by the MWCOG Transportation Planning Board. The Dulles Corridor Rapid Transit Project is included in the *Financially Constrained Long Range Plan*. Therefore, the project conforms to the SIP, subject to continued approval of the *Constrained Long Range Plan* by FTA and EPA and eventual full conclusion in an approved and conforming TIP. Near-term phases of the project are included in an approved conforming TIP (FY01). As the dates for implementation of the later phases of the project approach, they will be included in approved and conforming TIPs

Currently, the Dulles Corridor Rapid Transit Project is included in the MWCOG CLRP and TIP. Therefore, because the project is part of the approved CLRP and the TIP for the entire region, there is no regulatory requirement to prepare a project-specific emissions inventory (i.e., project level conformity is assumed).

For the intersections and the park-and-ride facility analyses, CO concentrations were evaluated for the existing conditions in 2000, and the future conditions for the Baseline (or No-Build) Alternative and the four Build Alternatives. Because the project may be built in phases, the future conditions were analyzed with 2006 as the opening year for the BRT and BRT/Metrorail Alternatives; 2010 as the opening year for the full Metrorail Alternative; and 2025 as the project design year for all alternatives.

Although there may be concern about severe traffic congestion along major highways of the area, there are currently no federal or State regulations or requirements to analyze the CO concentration along highway mainlines. Furthermore, the adverse levels of CO due to traffic on highway mainlines are very unlikely to occur for two reasons: (1) recent model year vehicles have relatively low emission rates and (2) the rapid drop off of CO concentrations due to the large distances between the travel lanes and receptors located beyond the highway right-of-way. For these reasons, EPA and DEQ do not require assessment of CO concentrations from highway mainlines.

5.1.1 Analysis Methods

The analysis methodology consists of an intersection assessment and a dispersion modeling analysis for computing CO concentrations at candidate intersections along the corridor.

Intersection Screening

Motor vehicles emit CO at the highest rates when they are operating at low speeds or idling in queues. For this reason, the potential for adverse air quality impacts is greatest at intersections where traffic is most congested. EPA has specified criteria (U.S. EPA-454/R-92-005, *Guideline for Modeling Carbon Monoxide From Roadway Intersections,* November 1992) based on traffic level of service (LOS) and volume for screening the intersections in the study area and selecting intersections for detailed air quality analysis. Level of service is a measure of the performance of the intersection in processing the volume of vehicles attempting to pass through it. Level of service is expressed as a letter rating based on the amount of overall delay at the intersection, where LOS A is best and LOS F worst. The EPA's LOS criterion states that intersections that currently operate at LOS D or worse, or would operate at LOS D or worse under future conditions, should be considered for air quality analysis. In applying the EPA screening procedure to the project, the candidate-signalized intersections in the traffic study area were ranked by LOS and by total volume in accordance with the guidelines. The intersections with the worst LOS and those with the highest volumes, or a combination of the two, were selected for detailed air quality analysis.

Based on the results of the intersection screening analysis, 15 sites listed in Table 5-2 were selected for analysis. Figure 5-2 illustrates the locations of these sites.

In addition to the intersection analysis, a typical park-and-ride facility was modeled to assess the potential air quality impacts of such facilities. The Route 606 Park-and-Ride Facility was selected as a worst-case representative because it is the largest planned park-and-ride facility, and experiences a high ratio of demand to capacity. The Route 606 facility is likely to experience a high degree of traffic congestion and, consequently, high CO concentration levels. The park-and-ride analysis also includes the adjacent intersections of Route 789/Lockridge Road with the Park-and-Ride Entrance Road and the Park-and-Ride Exit Road. These two additional sites are also listed in Table 5-2.

eliminate impacts in the areas above the tunnel and station, but would increase the potential for localized impacts at the tunnel portals and station access shafts where equipment must enter and excavate must be removed. Alignment T1 includes the tunnel section but only three stations, and accordingly, would be expected to have generally less potential impact than the other alignments.

Construction of the Phased Implementation Alternative would involve the implementation of BRT and Metrorail over an extended period of time. Although the construction effects would be the same as those described above for the other three alternatives, the timing would be different. The effects of constructing Metrorail through Tysons Corner would add to the effects of constructing BRT between the Orange Line and Loudoun County. These effects would then be followed by the effects of constructing Metrorail from Tysons Corner to the end of the study area in Loudoun County. Small increases in fugitive dust and emissions from construction equipment would occur as a result of Phased Implementation over what is described above. This would occur as a result of the demolition of the Spring Hill Road Station, the BRT ramps between the Tysons West Station, and extension of the construction period that would occur during phased implementation.

On a corridor-wide basis the potential air quality impacts due to construction of the BRT Alternative would be least, the impacts from construction of the BRT/Metrorail Alternative would be greater, and those of the Metrorail Alternative and the Phased Implementation Alternative would be largest. For the rail alternatives in Tysons Corner, the expected potential impacts would be least with Alignment T1, somewhat greater with Alignments T6 and T9, and greatest with Alignment T4.

5.3 CONSTRUCTION MITIGATION

Direct emissions from construction equipment would not be expected to produce adverse effects on local air quality provided that all equipment is properly operated and maintained. Appropriate mitigation could consist of assurance of proper operation and maintenance, specification of low-emissions equipment (EPA Tier 2 compliant, alternative-fueled, or retrofit with emissions controls), and prohibition of excessive idling of engines.

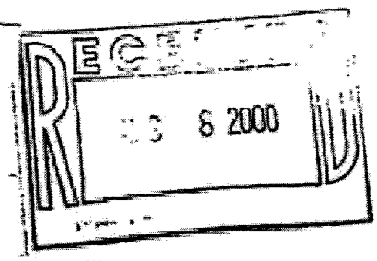
Traffic management techniques are available during the construction period that could mitigate increased emissions from traffic congestion due to lane closures, detours, and construction vehicles accessing sites. Examples of these techniques include development of site-specific traffic management plans; temporary signage and other traffic controls; designated staging areas, worker parking lots (with shuttle bus service if necessary), and truck routes; and prohibition of construction vehicle travel during peak traffic periods.

Potential fugitive dust impacts can be mitigated through good "housekeeping" practices such as water sprays during demolition; wetting, paving, landscaping, or chemically treating exposed earth areas; covering dust-producing materials during transport; limiting dust-producing construction activities during high wind conditions; and providing street sweeping and tire washes for trucks leaving the site. Such practices during construction would meet VDEQ regulations for fugitive dust and emissions as outlined in VDEQ regulation 9 VAC 5-50-90.

Predicted CO Concentrations: Intersections

The air quality modeling analysis for the BRT/Metrorail Alternative was conducted in the same way as for the Baseline and BRT Alternatives. The project team determined that Tysons Corner

6.0 CONCLUSIONS



As shown in Tables 5-5 to 5-10, carbon monoxide concentrations do not vary appreciably between the BRT, Metrorail, BRT/Metrorail, Phased Implementation alternatives, nor will they vary from the Phased Implementation Alternative, indicating a fairly equal diversion of vehicles into transit under each of the selected alternatives.

The project is not predicted to cause or exacerbate a violation of the applicable NAAQS, and with respect to regional emissions and conformity, the project has been shown to conform to the SIP. No mitigation measures are necessary with respect to compliance with the transportation conformity requirements.

Construction activities have potential to produce short-term, localized air quality impacts. These potential impacts can be minimized with appropriate mitigation measures.

Mr. Leonard Alfredson, PE
Washington Metropolitan Area Transit Authority Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Blvd., Suite 300
Arlington, Virginia 22209

Subject: Dulles Corridor Rapid Transit Project – PE/NEPA Agency Scoping Comments

Dear Mr. Alfredson,

As the Federal Transit Administration (FTA), Virginia Department of Rail and Public Transportation (VDRPT) and Washington Metropolitan Area Transit Authority (WMATA) are preparing an Environmental Impact Statement (EIS) for the multi-phased Dulles Corridor Rapid Transit Project (DCRTP), Virginia Department of Transportation (VDOT) looks forward to a very successful and well coordinated effort on this very exciting project. We acknowledge and fully support the Governor's and the Secretary of Transportation's identification of this project as one of the high priority projects for the region.

Per your request, VDOT offers the following input and comments, and requests your incorporation of these issues in the scope of work for the EIS:

- The DCRTP should include the following roadway improvement projects currently programmed by VDOT:

  1. Widening of Route 7 to 6 lanes, from:
     - Rolling Holly Drive to Reston Parkway. Tentative location public hearing scheduled for Summer of 2001 and construction advertisement for Summer 2003.
     - Reston Parkway to Dulles Toll Road (DTR) (including the interchange at Route 7 & DTR), currently planned to coincide with the schedule above; however, this segment is only funded through the preliminary engineering phase at this time.

  2. Reconstruction of the DTR interchange at Hunter Mill Road, which will also consider ancillary improvements to Hunter Mill Road and Sunset Hills Road necessary to increase operational efficiency of the interchange. A location public hearing is currently scheduled for Spring of 2001 for Phase I, which will result in identification of construction improvements for the mid and long terms.

3. Realignment of Hunter Mill Road from Hunter Station Road to Sunrise Valley Drive (on proffered right of way) is currently scheduled for a location public hearing in the Winter of 2002, with construction advertisement scheduled for Summer of 2003.

4. Construction advertisement of additional toll collection capacity on the westbound DTR ramp at Spring Hill Road is scheduled for Spring 2001.

5. Implementation of an open toll plaza configuration for the two adjacent "Smart Tag only" lanes at the DTR's Main Toll Plaza (both directions) is scheduled for Fall of 2000.

6. Widening of Route 123 to 6 lanes from I-495 to DTR is currently in the final design phase with construction advertisement scheduled for December 2000. This project is managed by Fairfax County under an agreement with VDOT.

- The Fairfax County Department of Public Works and Environmental Services is currently developing design plans for replacement and additional bus-only slip ramps between the DTR and Dulles Airport Access Road (DAAR). The DCRTP should also include these improvements.

- According to the Fairfax County Comprehensive Plan and the current 1999 regionally adopted Constrained Long Range Plan (CLRP) (interchanges not specifically identified) the following improvements are planned by 2010. These planned improvements must be considered and evaluated during this phase of DCRTP:

1. Widen Route 7 to 8 lanes from DTR to I-495
2. Widen Route 7 to 6 lanes from the Fairfax. Co. Parkway to DTR (this will necessitate reconstruction of the DTR Interchange)
3. Widen Route 123 to 8 lanes from Route 7 to I-495
4. Widen Route 123 to 6 lanes from I-495 to Great Falls Road (segment between I-495 and DTR is funded and currently underway, see #6 above)
5. Interchanges @:
    - Route 123 & International Drive
    - Route 7 & International Drive
    - Route 7 & Westpark Drive
    - Interchange modification at Route 123 & Route 7
6. Widen DAAR to 6 lanes
7. Capital Beltway study (may result in I-495 reconfiguration of its interchanges with DTR and Routes 7 & 123) currently underway

Currently under review, the year 2000 CLRP is anticipated to be adopted by Fall of this year. Upon adoption of the Plan, the year 2000 inputs should be used for the PE/NEPA process for the DCRTP.

As agreed upon at the July 11, 2000 pre-scoping meeting, the PE/NEPA process for the Dulles Corridor Rapid Transit Project will develop concept and design plans at 30% for these projects. The design of the highway improvements will be carried to the same level of design as the rail project at this stage, so that potential conflicts among all the transportation elements will be avoided. To that end, we recommend that WMATA initiate working technical meetings with VDOT and FDOT during the

NEPA/PE phase to address technical issues, and particularly, the co-location of the rail alignment with future roadway improvements in Tysons Corner.

- Per the July 11th pre-scoping meeting discussions, the PE/NEPA process will continue the effort to define system requirements for the proposed technology concepts (as described in the adopted "Dulles Corridor Rapid Transit Project Technology Implementation Plan"). It is critical to further define technology tasks in various phases and to assimilate the outcome into the project design. The refinement of the technology could be undertaken by the existing Technology Task Group and/or an ITS design consultant. 6.11.3

- Presently, VDOT and Fairfax County Staffs have been closely working with elected officials and citizen representatives from the Tysons and Reston Communities per House Joint Resolution 276 (House Document No. 23 - Tysons Corner Interim Transportation Improvements), General Assembly of Virginia, 1999; and Senate Joint Resolution 335/ House Joint Resolution 335 (Senate Document No. 35 - Transportation Improvements for the Reston Area), General Assembly of Virginia, 2000. The Town of Herndon has recently initiated consultant procurement to complete concept design, traffic analysis and engineering feasibility for the provision of pedestrian and vehicular access from Herndon to the planned BRT and rail station at the Herndon/Monroe park & ride facility. We recommend that pedestrian circulation, as well as other recommendations identified as part of these three efforts, be incorporated into the PE/NEPA process at this early stage. 6.9.2

- The 2020 Plan, adopted by the Northern Virginia Transportation Coordinating Council, provides the overall vision guiding transportation improvements over the next 20 years. The Plan will serve as a useful resource for the Dulles Corridor Rapid Transit Project during the PE/ NEPA phase. 6.7.7

Finally, we recommend that the technical staff currently working on parallel tracks on several subjects work together to facilitate a balanced multi-modal transportation system. These subject areas are: Land Use Density, Travel Forecast, Highway Design, Rail Stations /Alignment, and Pedestrian Circulation. This is the appropriate time for the technical staff currently working on these separate areas to share and test ideas in a coordinated manner. 6.7.7

Thank you for providing this opportunity for VDOT to comment on this very important project. As in the past, my staff and I will be available to provide technical assistance or to help clarify any issues.

Sincerely,

Thomas F. Farley

CITY OF FALLS CHURCH
CITY MANAGER'S OFFICE

Falls Church Transportation Plan

Mr. Hector A. Rivera
City Manager
Harry E. Wells Building
300 Park Avenue
Falls Church, Virginia 22046-3332

Dear Mr. Rivera:

Thank you for your review of the suggested scope of work for the local transportation plan and the task oriented development for a small urban area.

We have asked the Transportation Planning Division to review the City's comments and recommendations for inclusion in the scope of work to address your particular concerns. Also, we have requested they provide an estimate of the cost for a transportation study of this size and nature so possible funding sources may be investigated.

With these issues and task underway, it will take about 30 days to complete. I would suggest your meeting with the Secretary, District Administrator and yourself be postponed until the middle of August so sufficient information may be available to discuss possible funding sources.

Sincerely,

Reginald H. Beasley, Jr.
Urban Programs Engineer

December 7, 1999

RECEIVED
DEC 14 1999
CITY OF FALLS CHURCH
PLANNING

Mr. Willie Best, Acting City Manager
City of Falls Church
300 Park Avenue
Falls Church, VA 22046-3332

Subject: Falls Church Comprehensive Traffic Management Study Plan

Dear Mr. Best:

Last month you, Otis Smith, and I met to review the status of discussions between the city and VDOT on a comprehensive traffic management study plan for the city of Falls Church.

The city continues to hope VDOT will underwrite a comprehensive study with some "VDOT grant-based" funding. VDOT continues to offer existing data and technical advice on development of the city's scope-of-work.

At the city's request, VDOT's Transportation Planning Division developed a conceptual scope-of-work for the city to tailor to their needs. A rough cost estimate indicated $1.35 million. In a letter of August 5th, Reginald Beasley of VDOT's Urban Division indicated "...the Department has limited resources in both staffing and funding to pursue a study of this magnitude."

When we met in November, we discussed ways to trim the overall costs by having city and VDOT staff undertake some of the tasks in the city's June 25, 1999 scope-of-work letter to Reggie Beasley (from Hector Rivera, City Manager). I have copied and numbered the list below:

1. A comprehensive inventory and assessment of existing transportation facilities, parking facilities, and traffic conditions in the city – vehicular and non-vehicular (pedestrian, bicycle, and mass transit). This should also note deficiencies.
2. A review of the existing transportation systems in Arlington and Fairfax counties and previously developed regional transportation plans.

RECEIVED
DEC 9 1999
CITY OF FALLS CHURCH
CITY MANAGER'S OFFICE

3. A forecast of traffic, travel, and parking demand as result of (a) the BRT, (2) future rail links to metro, (3) future anticipated development within and near the city, (4) the above scenarios if HOV does not exist on I-66, and (5) the above scenario if HOV begins at Route 29 instead of the Beltway.
4. An identification of future transportation needs and deficiencies.
5. An assessment of the projected impacts on special needs populations, in particular the elderly and physically disabled.
6. A comprehensive and workable Transportation Management Plan that includes alternatives for state of the art traffic-calming techniques as well as for each mode of transportation and commensurate parking resources. This plan must meet the goal and objectives as stated.
7. A model that demonstrates this plan.
8. An implementation plan.
9. Public information made available for the city's web page.

You indicated that city staff could undertake numbers 1, 5, 8, and 9. I indicated VDOT could provide information on existing systems from the draft 2020 plan for number 2 and the 2020 model and assumptions for number 3 [(subtasks ("a"), ("2"), and ("3")]. Future transportation needs (number 4) at the broad-brush level are available from the draft 2020 plan and that information could also be provided.

We decided that neither the city nor VDOT staff could undertake the city level specific details from 2, 3, and 4 and all of numbers 6 and 7. Numbers 6 and 7 require a transportation consultant to pull all the information together, analyze the data, and develop a plan and model.

I spoke last week with Ken Lantz, Division Administrator for VDOT's Transportation Planning Division in the Central Office. He suggested the city apply to FHWA for the Transportation and Community System Preservation Pilot. The program is "...a comprehensive initiative of research and grants to investigate the relationships between transportation and community and system preservation and private section-based initiatives." I've attached a copy of the Tea-21 brochure page describing the program. I've also included a reference out of ITE Washington Weekly for this FHWA program.

Another source of information we discussed when we met was the environmental document under National Environmental Policy Act (NEPA) for the Dulles Corridor Transportation Study. The supplement to the earlier Dulles Corridor Transportation Study was recently released and the NEPA document is one of the next steps.

As stated in the city manager's letter of June 25th, the Dulles projects, with their connections to the East and West Falls Church Metro stations, will significantly compound the city's existing problems. The impacts of the BRT and rail project on the metro stations and adjacent neighborhoods should be an important part of the environmental document. The data and analysis of the impacts and the development of mitigation measures should contribute to needed

information for the city's transportation plan. I suggest you speak with Mr. Leo Bevon, Director of VDRPT, the state agency leading the Dulles initiatives, about the environmental document and opportunities to work with the consultant team.

Some of the city's concerns rest with cut through traffic, speeding, and parking. Traffic calming studies are usually conducted at the local level with extensive community involvement and with advice from VDOT's Traffic Engineering staff. There are two high profile traffic calming studies in Northern Virginia: the Highway 50 Traffic Calming Study funded under federal TEA-21 and Georgetown Pike traffic calming which came out of 1999 state legislation as a study, but with no appropriation. Ilona Kastenhofer, the new VDOT Traffic Engineer, is chairperson of VDOT's traffic calming committee and is a participant in both of these studies. She can be reached at (804) 786-2965.

The City of Falls Church has a number of transportation and land use challenges ahead. VDOT will support the city where we can with data and technical advice. We do not have grants to fund developing a citywide comprehensive transportation/traffic calming/redevelopment plan as envisioned by former city manager Mr. Rivera. I understand Mr. Rivera hoped that Secretary Ybarra would be able to help the city secure funding for the comprehensive study. I suggest you explore the options I have outlined above and then return to Secretary Ybarra to address the funding question. Perhaps she would have additional options to suggest. As you progress with the development of your study, please let me know if the Transportation Planning Section and/or the Northern Virginia District can be of assistance.

Sincerely,

Jo Anne Sorenson
Assistant District Engineer for Planning and Development

Subject: Comments for R02-1

All work to be performed in, over or under, waters within the Commonwealth of Virginia, require the submission of a Joint Permit Application (JPA) to the Virginia Marine Resources Commission (VMRC). VMRC would then act as the clearing house, distributing copies of the application to state, local and federal agencies for review and comments.

Detailed engineered plans showing the exact location of all water crossings will be required to determine whether or not a permit will be required from the Marine Resources Commission.

The review and permitting process normally requires a minimum of 90 days, so it is advised to contact this agency as soon as final plans are complete, to allow ample time for public notice and permitting.

Copies of the JPA are available on the internet, or by contacting this office.

KATHERINE K. HANLEY
CHAIRMAN

December 17, 2003

The Honorable Whittington W. Clement
Secretary of Transportation
Ninth Street Office Building
202 North 9th Street
Richmond, Virginia 23219

Dear Secretary Clement:

At its meeting of December 8, 2003, the Fairfax County Board of Supervisors affirmed its endorsement of the revised Locally Preferred Alternative (LPA) for the Dulles Corridor Rapid Transit Project. The Board recognizes that constructing Phase I of this rail extension represents the essential first step to constructing the full LPA to Dulles Airport and Route 772 in Loudoun County. While we understand that the Federal Transit Administration will be considering funding Phase I of the Project, the Board also recognizes that as the financial plan continues to be refined, other phasing, timing and financing options may have to be evaluated and pursued. The Board supports such efforts that will help in advancing this project to final design and construction. The Board also urges that the Commonwealth work closely with WMATA to explore other options for accelerating the engineering work on this project. Therefore, we encourage and support the Virginia Department of Rail and Public Transportation's efforts to conduct preliminary engineering for the entire project.

The Board has the following comments regarding the Supplemental Draft Environmental Impact Statement:

- The Board requests that construction of the parking structure at the Wiehle Avenue Station not commence until the Full Funding Grant Agreement for Phase II is executed. However, deferring such construction should not preclude land acquisition and station access improvements at this station.

- Pedestrian access to all stations needs greater attention from the Project Team. Station plans should clearly show pedestrian access points and necessary adjacent facility improvements such as cross walks and sidewalks/trails. Station plans should clearly show pedestrian access points and necessary adjacent facility improvements such as cross walks and sidewalks/trails. Alternate points of access to the Tysons West and

Tysons Route 7 Stations should be evaluated. Staff is collaborating with a subcommittee of the County Non-Motorized Transportation Committee to identify pedestrian facility improvements that should be constructed between now and the initiation of rail service.

- The traffic mitigation measures identified in the SDEIS should be programmed by the Virginia Department of Transportation at the earliest possible date so that they are constructed before the rail system begins operation.

- At the Tysons West Station, consideration should be given to locating the parking facility and pedestrian access on the south side of Tyco Road. Locating the parking structure on the south side of Tyco Road may be more favorable to joint development. Locating pedestrian access on the south side of Tyco Road may serve a greater number of pedestrians.

- The County requests technical back-up information quantifying the benefits of the noise mitigation measures proposed for the West Falls Church S & I Yard and the efficacy of the noise mitigation measures for aerial sections of track.

- Facilities associated with the Tysons East Station are impacted by a Resource Protection Area (RPA) and an Environmental Quality Corridor (EQC). Several proposed stormwater management facilities at other sites are, or may be, in "new" RPAs as adopted by the Board on July 7, 2003. Coordination with County staff is necessary to ensure that these issues are addressed appropriately.

- The County requests further information regarding proposed stormwater management measures for several of the station facilities (Wiehle Avenue; Tysons West; and Tysons East), as no such measures are identified on the proposed general plans for these facilities. Stormwater management and best management practice measures should, at a minimum, be consistent with County requirements.

As you know, the Express Bus System in the Corridor, operated by the County with support from VDRPT, has been immensely successful. Until rail is operating, the County needs VDRPT's continued support to maintain and enhance this service. The LPA included incorporating elements of Bus Rapid Transit into the existing bus operation. In reality, existing express bus service already is Bus Rapid Transit in many respects. However, adding additional BRT elements

between now and the opening of Phase I rail would enhance the system consistent with the LPA selection and would continue to build ridership for rail.

The Board considers the Metrorail extension through Tysons Corner to Dulles Airport and Loudoun County to be of the highest priority. We commend the Commonwealth and the Project Team on its progress and commitment, and we pledge to continue our partnership with you to move this key project forward as expeditiously as possible.

Sincerely,

Katherine K. Hanley

MR. KLINGE: I am sure that many of you here tonight are anxious to provide us with your comments, concerns and suggestions. As explained at the beginning of the meeting, we will hear from people who registered in advance first followed by those registered tonight. If you have not signed up yet, please see Mr. Fairfax McCandlish at the registration desk at this time so that we can accommodate you.

If you wish to provide comments and do not wish to speak tonight at tonight's hearings, I encourage you to fill out a comment form, write us a letter or send us an e-mail. We will be accepting comments until the public-comment period closes at 5:00 p.m. on December 20, 2003.

Now I shall introduce the public officials here present to testify. The first is Supervisor Kathy Hudgins.

MS. HUDGINS: Good evening. I am Supervisor Kathy Hudgins of the Hunter Mill District. I am here, first of all, to welcome you to the Hunter Mill District. I want to make note

that this Supplemental Draft EIS is reflective of representing nearly all of the Hunter Mill District. I want to make note that the District and the two stations starting at Tysons Corner between 123 and Route 7 and the toll road are part of Hunter Mill District and the remaining stations that are part of the Fairfax County and Dulles Corridor Are part of the Hunter Mill District.

I note that however the area to be served by this project is a very critical area to Hunter Mill District. As you will hear testimony tonight, I hope that you will keep in mind the growth in this District, the traffic congestion that we face and the critical importance of solving those problems.

The Board of Supervisors approved the local preferred alternative last year for the full project. I believe, as we look at the Supplemental Draft EIS, the testimony that was heard at that time will reflect that as well as support for rail in the Corridor.

I know that we will hear some concerns

about it, but I think that, as we address those concerns, I hope that we will be able to complete our commitment that we made when we supported the local preferred alternative in the Corridor.

I would like to a moment, in that you have indicated that public officials have ten minutes; the Reston Association is a homeowner association of over 50,000 people. Susie Jones is here to testify for us and I hope that you will be able to incorporate as much time as possible for her to provide her testimony.

Thank you very much.

MS. HANLEY: Thank you.

MR. KLINGE: Thank you. Next is Delegate Ken Plum.

MR. PLUM: Thank you very much and good evening. My name is Kenneth Plum. I welcome you to my neighborhood. I live two blocks down the street at 2073 Cobblestone Lane, Reston. I speak to you tonight as a member of the Virginia House of Delegates representing the 36th District but I also speak as Chairman of the Dulles Corridor Rail

21,316 MR. CONNOLLEY: Thank you, Madame Chairman, and thank you all for being here and for having this public hearing. I support the Metrorail alternative and have voted for the local preferred alternative and I believe that a number of the refinements contained in the Supplemental Draft EIS reflect a number of the concerns that both the public and a number of local elected officials had.

This Corridor, as you have heard tonight, is going to be the second largest employment center in the region next only to Washington, D.C., itself. The idea that the second-largest employment center in the region, one of the most vibrant regions in the United States, would not be served by rail is, to me, something we don't want to contemplate.

We have replanned much of the land in the Corridor in advance of rail. Tysons was replanned in 1994. Merryfield was replanned a couple of years ago. The Dulles Corridor, including Reston and Herndon, were replanned about a year and a half

ago in anticipation of rail.

Rail has, as was pointed out in the study, the largest capacity. While bus rapid transit may serve on an interim basis in parts of the Corridor, it won't work in Tysons because it competes with the same congestion the rest of us do. And, at the end of the day, it only has about a third of the capacity of rail.

One might note that one of the places frequently cited and traveled to to study bus rapid transit and the efficacy of bus rapid transit is Curitiba, Brazil, had recently issued an RFP for guess what? Rail, because it has run out of capacity.

I think the experience of our region is if you build it, they will use it, when it comes to mass transit. One of the critical pieces that we don't yet have in this region in sufficient quantity is choices for people. Give us choices. In all too many instances, the only choice most of us have is to get in our automobile to go from Point A to Point B, whether it be to commute to

work or whether it be other kinds of travel, taking the kids to soccer or going to church or synagogue or temple or whatever it may be.

I believe one of the critical pieces of rail is providing a key choice in a key corridor that could move 86,000 people a day.

Now, the other thing one is struck by in listening to much of the testimony, especially the critical testimony and many of the folks make [illegible] points about this concern or that concern. But, you know, at the end of the day, it is awfully hard to get anything in this region in transportation. If you want, there must be at least 3 billion problems and reasons why you shouldn't go forward with a project like this.

I think leadership is about leading. At some point we have to decide this is the right thing for our region, this is certainly the right thing for our community. Is it perfect? Not much in life is. Does it have some problems and flaws? Undoubtedly, it does. But is there a better alternative? In my mind, no; there isn't. Can we

afford the continue to dither and delay and find fault and reason not to proceed? I don't believe so.

The time is now. We have to move forward with this project. I just won an election saying that rail to and through Tysons on the way to Dulles is my top transportation priority and I promise you, over the next four years, it is going to be the top transportation priority in Fairfax County.

Thank you so much for having this hearing and thank you for hearing me tonight.

MS. HANLEY: Thank you. And thanks to all of you that have helped us put this on tonight and thanks all of you for coming. We are adjourned.

(Whereupon, at 9:45 p.m., the meeting was adjourned.)

This shall serve as Hunter Mill Supervisor Cathy Hudgins' official public statement on the DEIS for the Dulles Corridor Rapid Transit Project.

Thank you.

<<DEIS Public Hearing.doc>>

Public Record Comments
Draft Environmental Impact Statement
Dulles Corridor Rapid Transit Project
Supervisor Catherine M. Hudgins

The first phase of a transit system in the Dulles Corridor was initiated in 1968 when Reston citizens established the Reston Commuter Bus System. This customized service was an immediate success for the community and received national recognition. In an attempt to keep pace with increased growth and to meet the needs of a more transit-oriented developed community, the system continued to grow and was later absorbed into the Washington Metropolitan Area Transit Authority and now the Fairfax County Connector Service.

Thirty-four years later, the corridor has the opportunity to complete the original Dulles Corridor transit system. When completed, the system should receive equal praise as the first phase and be as successful as the planned community of Reston it serves. Most importantly, a Dulles Corridor Rapid Transit Project (DCRTP) should provide a world class, comprehensive transit system, which will allow the Dulles Corridor and its surrounding communities to contribute to the ease of transportation in the capitol region. In addition, the project will connect Dulles Corridor to Dulles International

Airport, which is vital to the continued growth and development of the region.

In the last several decades, the Reston community, including residents and businesses east and west, have been actively engaged in studies, task forces and land use planning in preparation for rail. In May 2001, the Fairfax County Board of Supervisors approved changes to the Comprehensive Plan to allow for transit oriented development around the station areas. In March 2002, over 185 members from the community participated in a Charrette to explore how best to reflect the community's desires in developing the land areas for the Wiehle Avenue and Reston Parkway stations. Following the Charrette, I appointed a group of citizens to review and provide recommendations on the Draft Environmental Impact Statement. Included in this statement are those citizens' recommendations.

The Mid-Corridor of the DCRTP consists largely of Hunter Mill District, from Tysons Corner to Dulles International Airport. This area comprises over 120,000 residents, 12 million square feet of office space and six of the nine proposed rail station locations. Today, many of these residents, employers and employees face inconvenience, diminished quality of life and

the risk of economic stability as they await relief from congestion in their communities. While there are concerns that must still be addressed in the Final EIS, it is now time for federal, state and local officials to respond to the transportation needs of this community by supporting the DCRTP.

The summer of 2002 has been one of the worst in terms of air quality as measured by Code Red days for the region. It is time to cease debate and studies. The matter of relieving congestion and addressing the severe damage to the region's air quality requires that we act now. This project is long overdue. It is time to build rail in the Dulles Corridor, now.

As Hunter Mill District Supervisor, the following not only reflects my view but is also input gathered from numerous community venues. In general, there is as a consensus of support for rail now as the Local Preferred Alternative. While there are those that fear that the outcome of rail may be detrimental to the community, I believe that the rail alternative over the BRT or No Build alternatives is critical to maintaining the quality of life and the economic stability of the surrounding communities in the Dulles Corridor.

The following represents some specific concerns while supportive of the project.

- Support full Metrorail as the Locally Preferred Alternative
- Implement the Metrorail alternative as soon as legally and financially feasible, with strong consideration to provide immediate service through the Corridor to Dulles Airport, given it is the most cost-effective option to best serve Hunter Mill residents and businesses.
- Immediately begin to implement additional enhancements to the rapid express bus service in the Corridor as interim service prior to Metrorail.
- Respond to neighborhood noise concerns by including noise walls or other mitigation for Polo Fields, Westwood Village and Chatam Fords communities
- Urge Virginia Department of Public Rail and Transportation to remove from the financial analysis the increase tolls, at least until the construction of the earliest phase of the project
- Provide increased pedestrian/cycle access to the transit stations of Wiehle Avenue, Reston Parkway and Tysons Corner and particularly as a means of allowing for reconnecting the north-south Reston communities.
- Mitigate visual impact of the construction of Dulles Corridor Rapid Transit Project by incorporating innovative design features, enhanced lighting, public art and green space.

- Provide safety and security to the community and the rail system by delineating law enforcement roles and through early implementation of rail to provide needed transportation capacity in the corridor for emergency or disaster events
- Maintain implementation options for rail that do not preclude addressing the issues of air rights.

Rail in the Dulles Corridor will change the community. I urge that you consider the views expressed here in order to assure that the arrival of the Dulles Corridor Rapid Transit Project will provide change that will greatly enhance the quality of life for the residents and businesses of the corridor for years to come.

Mr. Corey Hill, Northern Virginia Rail Manager
Virginia Department of Rail and Public Transportation
3900 Jermantown Road Suite 300
Fairfax, VA 22030

Dear Mr. Hill,

I am writing to raise concerns that I have regarding the designs of the future rail stations in Tysons Corner. I understand that when Metro is extended to and through Tysons Corner there will be a need for commuter parking. In the interim, before metro is extended from Tysons to Dulles, there will also be a need for a terminus station with ample parking. While I support parting facilities at Tysons's West I am deeply concerned that the existing DPRT / WMATA design proposal for the interim terminus station in Tysons Corner, that includes a 2,000 space parking garage on Leesburg Pike, would catastrophically effect traffic flow on Route 7 resulting in gridlock affecting most of Tysons Corner.

I strongly encourage and would fully support DPRT / WMATA to think outside the box by seriously looking at alternative design opportunities to integrate ample parking for metro with mixed-use development on and around this future metro station. To achieve that end, I encourage DPRT / WAMATA to work with the development community to explore creative ways to fully take advantage of all the opportunities that future rail stations would provide. The public investment in the extension of Metro is too great to ignore opportunities to maximize that investment.

It would be a tragic lost opportunity if we do not innovatively attempt to coordinate and integrate land use with the extension of metro to Tysons Corner. By partnering with all stakeholders we have an opportunity to preserve and improve the existing success of Tysons Corner resulting in the improvement of traffic circulation and creating pedestrian friendly civic space where none now exists. I look forward to working with DPRT /WMATA, the development community and citizens to create a more effective transportation system in Tyson's Corner.

Sincerely,

Gerald E. Connolly

Mr. Corey Hill
Northern Virginia Rail Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard
Arlington, Virginia 22209

Dear Mr. Hill:

Please enter the following comments into the official public record for the Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement:

We stand at a pivotal moment in Fairfax County's history. For the last twenty years, elected officials, government agencies, and the public have talked about extending rail through Tyson's Corner to Dulles Airport. While that was taking place, Tyson's Corner grew up: businesses flocked there creating 30 million square feet of office space and close to 100,000 jobs and more than 20 million people began visiting Tyson's Corner Center and Tyson's II annually. Tyson's Corner grew to become a business district that, if it was its own city, would be larger (in terms of employment) than St. Louis or Miami. All of this success, however, has not come without a price.

Without mass transportation, all of these workers and visitors are forced to travel to Tyson's Corner by car. Finally after years of talking, we have reached the point where decisive action is called for. We are ready to bring mass transit to Tyson's Corner and the Dulles Corridor.

Integral to any public project of this size is an intelligent and practical funding plan. For Fairfax County, the funding pieces have come together in an unprecedented way; we are now uniquely positioned to capitalize on new, dedicated funding sources that will reduce or replace the County's local contribution. The November transportation referendum includes $350 million specifically for the Dulles corridor transit project: its passage is critical for the success of the project. That funding coupled with the revenues from the proposed special tax district will fund most of the local share.

The current density and size of Tyson's Corner justify the extension of rail now. Predicted growth in jobs and retail space only underscore the urgent need for mass transportation. Equally as important is growth in the number of residents in Tyson's that has occurred and will continue to occur as Fairfax County encourages increased transit-

oriented residential development pursuant to the 1994 Comprehensive Plan. It is imperative that transportation be provided to serve these people.

The Draft Environmental Impact Statement has laid out several viable alternatives. Close attention must be paid to the potential impacts of each to surrounding developments, especially residential. The road network in Tyson's Corner is at its limit. Important improvements can and will be made; however, the solution to Tyson's Corner's transportation problems is not in road expansion. And while there are some favorable characteristics of Bus Rapid Transit (BRT), there are clear advantages to rail: The capacity of rail is nearly four times that of buses and, under current proposals, no BRT stations would be located in the heart of Tyson's Corner. Moreover, BRT has significant up-front costs and will not encourage the concentration of density at transit hubs, the way rail, with its built-in density triggers, will. Rail will contain sprawl by creating a magnet for clustered development around stations and will maximize convenience to those living, working, and shopping in Tyson's. And, at a time when our region is struggling to meet EPA's ground-level ozone attainment requirements, rail transportation will improve air quality by removing the most drivers from the road.

While bringing rail to Tyson's Corner is my top priority, I believe it is imperative that transit ultimately be extended through the Dulles corridor to Dulles Airport. Washington, D.C. is one of the only capital cities in the industrialized world whose international airport is not served by rail. Demand for a rail link to Dulles will only increase as travel volume is expected to grow to nearly 32 million passengers by 2010. The opening of the new air and space museum next year is expected to attract millions more to the airport area. Furthermore, the closure of National Airport for months in the wake of September 11th is a compelling reminder of the reliance this region has on Dulles and the inconvenience of its missing rail link.

By 2020 Tyson's Corner and the Dulles corridor will be the second largest employment center in the region (second only to downtown D.C.). If we fail to act and provide multi-modal transportation alternatives, growth in jobs and population can only make traffic congestion on our area roadways worse. We cannot afford to be a victim of our own success, we cannot let the high quality of life that attracts so many people and jobs to Fairfax County in the first place be undermined by traffic congestion. We are on the verge of making our long awaited vision of rail service to Tyson's Corner and Dulles Airport a reality. The time to take bold steps to solve our transportation problems has arrived. Fairfax County and the Washington, D.C. region cannot afford to wait.

Sincerely,

Gerald E. Connolly

Corey Hill
Northern Virginia Rail Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard
Arlington, Virginia 22209

Dear Mr. Hill:

At its meeting of July 22, 2002, the Fairfax County Board of Supervisors expressed several concerns about noise and traffic impacts of the Dulles Corridor Rapid Transit Project documented in the Draft Environmental Impact Statement. The Board requested a written response addressing these concerns and plans for appropriate mitigation efforts. Three specific concerns were identified and these are noted below.

1) The first concern is about the impact of 26 additional rail cars at the WMATA Service and Inspection Yard at the West Falls Church Metrorail Station on homes in the Lemon Road community. Rail cars entering and leaving the yard at late night and early morning hours are a source of increased noise, loud horns and squealing brakes. The project team has identified this impact, but has not specifically proposed any mitigation strategies.
2) The current noise abatement recommendations for properties near Hallcrest Heights include a three-foot tall parapet along the aerial rail sections next to residential areas. It is clear that this may be insufficient to reduce the noise generated by the meeting of rails and wheels on a curve.
3) Significant noise and traffic impacts may be caused by the proposed 2000 car parking structure on Route 7 at Tysons Corner. The current proposals do not address the noise impact that could reasonably be expected from increased traffic.

Sincerely,

Katherine K. Hanley

Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Rohrer:

The staff comments on the Supplemental Draft Environmental Impact Statement attached to this letter provides additional detail on the comments contained in the December 16, 2003 letter from County Board Chairman Kate Hanley. A few additional comments are editorial or technical. Staff from the County's Department of Transportation and other County agencies look forward to continuing to work with VDRPT to complete the Environmental Impact Statement and to initiate preliminary engineering.

Sincerely,

DULLES SDEIS & GENERAL PLANS COMMENT FORM

Reviewer's Name: Karyn Moreland, FCDOT (703) 324-1141

[Vol.=Volume (SDEIS is Vol. I, Proposed General Plans is Vol. II), Page=Volume Page or Sheet Number, Volume Sec.=Section/Chapter Number]

Vol.	Page	Sec.	Comment
Gen			Clarify which transportation improvements will be done as a part of the project, and which are "mitigation" that may be completed by others.
I	6-14	6.1.3.2	Table 6.1-4 – FCDOT commented on the DEIS that during peak periods, Connector bus service would have no greater than 30 minute headways.
I	6-17	6.2.2.1	Table 6.2-1 – Does this take into account the proposed parking garage addition?
I	6-19	6.2.2.3	Table 6.2-3 – Is it reasonable to expect that in 2025 for LPA I only, PNR trips will decrease? It seems that once garages fill up, they remain that way. Also, with the full LPA, bus trips appear to drop significantly. Is that reasonable to expect?
I	6-24	6.3.2	With Wiehle as the interim terminal station, will there still be no additional effects on bicycle and pedestrian facilities with the LPA Phase I?
II	019		Tysons II development area may not be a realistic "contractor work area", as it will probably be developed prior to or during rail construction. Also, the area shown on this map does not match that shown in the SDEIS, Env. Conditions Sheet 3.
II	080		Option B appears to better fit the "mixed use" concept for land use near the station. Clarify which improvements are proposed with the project, and for those that are not, include them in the mitigation chart, 6.2-7. Also show pedestrian (e.g., crosswalks) improvements.
II	081		It is unclear whether the intersection improvements (lengthen SB Route 7 dual left) proposed with the DEIS are still proposed with the preferred LPA. Also, there are 2 "emergency stairs" proposed for the station. Could one of them be upgraded for use by regular pedestrian traffic?

DULLES SDEIS REPORT COMMENT FORM
Reviewer's Name: **Sterling Wheeler**
December 17, 2003

Vol.	Page	Sec.	Comment
I	1-7	1.3	In the fourth sentence of the 2nd paragraph, the reference to densities "ranging from 8 to 45 dwelling units per acre" is development potential without the rail intensity bonus; development potential with bonus can be 100 du/ac at some future stations. This sentence should be reworded as follows: "The Fairfax County plan calls for dense development in the corridor with intensities in excess of 1.0 FAR in future transit station areas. Higher-intensity, mixed-use development ..."
I	3-1	3.1	In the 2nd and 3rd sentence of the 2nd paragraph, the information about the Tysons II rezoning is not correct. The zoning case increased the PDC's potential from about 4,655,000 sq. ft. to 6,821,000 sq. ft. (or an increase of almost 2.2 million square feet). The maximum building height is 30 stories, not 25 stories. The development has 12 high-rise buildings of which four are built (or eight new buildings). The two sentences need to be corrected based on the information provided.
I	3-3	3.1.1.2	The second bullet under "B. Proposed LPA Phase I", is not true since the Comprehensive Plan envisions higher intensity at future stations west of Wiehle Avenue. This bullet should be reworded to indicate that the LPA Phase 1 is not consistent with the Comprehensive Plan; the wording could be similar to the 3rd bullet which addresses Loudoun County.
I	3-5	3.2	Figure 3.2-1a: The Regency and Encore high-rise multifamily development should be added to this map **(as well as Figure 3.2-1b)**; the development's location is inside the Beltway, south of Route 123 and abuts the Dolley Madison Village apartments.
I	3-6	3.2	Figure 3.2-1b: The land area of the Sheraton hotel should be removed from the area labeled Westwood Village.
I	3-22	3.3	Table 3.3-1 seems to have an error in the LPA Phase 1 (2025) and LPA Phase 1 (Opening Year) columns; since Phase 1 will impact fewer properties than the Full LPA, the acreage impacted should be notably less than 139.3 acres.
I	3-25	3.4.1.2	Under the last bullet on this page, the text refers to the "Hunter Mill Road Historic District". This area is not a "District"; the area is eligible for being considered for placement on the state or national registers; in other words a proposed "District". The bullet should be corrected by referring to this area as a "proposed district". References to this area are throughout the SEIS; all references need to be corrected; the following pages (which may not be a comprehensive list) include reference to this area: pages 3-28, 3-33, 3-35, 3-36, 7-2 and 7-4.
I	3-29	3.5	Figure 3.5-1a: The proposed Hunter Mill Road District is shown, but not labeled on this map.
I	3-33	3.5	Table 3.5-1: In addition to correcting the Hunter Mill Road District issue, the last row of the third column indicates that the Road has "not yet" been designated a Scenic Byway, which is not correct. The Road has been designated a Scenic Byway (page 3-37 correctly states that the designation occurred since the publication of the DEIS).

Vol.	Page	Sec.	Comment
II	13		Wiehle Avenue station: On the south side of the station, a pedestrian connection to the west should be provided that connects to a sidewalk on Association Drive or Commerce Park Drive; this connection should provide improved access from the residential areas along Soapstone Drive. Another issue concerns joint development on the north side of the station; the final EIS should demonstrate how transit improvements do not conflict with the County's joint development objective for this property.
II	17		Tysons West station: As indicated in the BOS comment, consideration should be given to locating the bus facility and parking to the south side of Tyco Road; the purpose is of relocating the facility is to improve joint development opportunities, to improve pedestrian access and to have potential improvement in bus access; for example two points of access (one from Tyco Road and one from Spring Hill Road) should be considered for this facility
II			The pedestrian connections are not shown for the Tyson Central 7 Station. 2

Reviewer: **Sterling Wheeler**

DULLES SDEIS & GENERAL PLANS COMMENT FORM
Reviewer's Name: Noel Kaplan
DECEMBER 17, 2003

COMMENTS ON SDEIS TEXT

Vol.	Page	Sec.	Comment
I	4-4	4.2	The SDEIS states: "Amendments to the Chesapeake Bay Preservation Ordinance have been proposed by Fairfax County . . ." Amendments to the Ordinance were adopted by the Board of Supervisors on July 7, 2003 and became effective on November 18, 2003. The SDEIS suggests that Intensely Developed Areas (IDAs) would be designated; this has not been done. However, Resource Protection Area (RPA) designations have been revised, with the effect being that the extent of RPAs in Fairfax County has grown considerably (per a State requirement). Several of the proposed stormwater management facility sites (P-6, P-8, P-14, and P-17) are, or may be, located in "new" RPAs. In addition, one of the proposed tie breakers (B-6) is in an area that has been mapped as a "new" RPA. The RPA designation would not necessarily preclude the construction of these facilities; however, exceptions allowing for these encroachments will need to be pursued and will probably require public hearings. It is noted that the tie breaker site and the site for proposed pond P-14 are located in areas that have been subject to extensive disturbance. Coordination with the Office of Site Development Services of the Department of Public Works and Environmental Services (703-324-1720) is recommended.
I	4-4	4.2	The proposed Route 28 station facilities north of the Dulles Toll Road may encroach slightly into a new RPA. Project designers should coordinate with the Office of Site Development Services on this issue.
I	4-27	4.7.1.2	The DEIS indicated that there would be 260 residences at the West Falls Church S&I yard that would be affected by noise levels from the yard in excess of 55 dBA (Fairfax County's stationary source noise standard for impacts on residential properties); this was attributed to wheel squeal associated with a 300-foot radius curve at the yard. The SDEIS commits to the enclosure of this curve as well as the enclosure of a new portal that would connect the main line of the tracks along the Dulles Connector Road with the S&I yard. The proposal to enclose the tracks should be commended; however, it would be helpful if the EIS would note what the noise reduction benefits of the enclosures will be as they relate to event-specific noise impacts—what will be the decibel reduction for individual events that would result from the enclosures? Will wheel squeal from the enclosed tracks be audible? If so, what will the event-specific decibel levels be on nearby residential properties? Will any residences still be exposed to noise levels from wheel squeal in excess of 55 dBA?
I	4-27	4.7.1.2	This section notes that additional storage tracks will be needed at the West Falls Church S&I yard "in order to increase the storage capacity from 26

Vol.	Page	Sec.	Comment
			rail vehicles under the Draft DEIS Metrorail Alternative to 42 rail vehicles for the proposed LPA." The new tracks would be located closer to residences than the existing tracks. No information is provided regarding the noise level increases that would be associated with the additional storage, although it is noted that the overall change in noise, when considering both the increased storage and the noise reductions associated with the proposed track enclosures, would be a reduction of seven decibels. It is not clear if this seven decibels reflects an overall average noise level reduction or if it is meant to apply to a hypothetical single event. In any case, more guidance should be provided regarding the nature of the increased noise impacts associated with the additional vehicles (e.g., train movements; horns), and whether there will still be any residential receptors exposed to single event impacts of 55 dBA or more.
I	3	Env. Cond. Sheets	As noted in my comments on the DEIS, facilities associated with the Tysons East station will, in part, be located in a Resource Protection Area. In addition, an Environmental Quality Corridor has been identified on the site of the proposed Tysons East Kiss and Ride facility. A contractor work area is identified near the Tysons East station site; part of this site is located in the RPA. However, much of the RPA in this area has already been disturbed and is impervious in character. Coordination with the Office of Site Development Services is recommended as early in the process as possible to address possible Chesapeake Bay Preservation Ordinance issues associated with the station location, the Kiss and Ride facility, and the contractor work area. Project staff should also be encouraged to coordinate with DPZ to identify possible approaches to addressing the Environmental Quality Corridor in this area.
I	6	Env. Cond. Sheets	Proposed stormwater management facility P9 is located in an area that has been established as a conservation easement. It is not clear if it would be feasible to construct a stormwater management facility at this location.
II	79, 81, 86, etc.	X	It is not clear if stormwater management measures are being proposed for several of the station facilities (e.g., Wiehle Avenue station facilities; Tysons West facilities, Tysons East facilities), as no such measures are identified on the site plans for these facilities. At a minimum, those facilities that will be provided within Fairfax County should include stormwater management and best management practice controls that are as effective as those required for private development projects. Project designers should also be encouraged to pursue low impact development (LID)/site design measures where appropriate (e.g., bioretention/biofiltration practices in parking lots) in order to reduce potential adverse impacts to streams. Many of the facilities identified in the documentation would lend themselves to such practices.

COMMENTS ON SDEIS GENERAL PLAN REVISIONS

Vol.	Page	Comment
Gen. Plans	Various	Ponds P-8 and P-9 (and others?) would be located on the other side of a noise barrier from the highway/rail. These ponds would not, therefore, appear to be able to collect drainage from the project site. Is this the case? Is the idea to establish compensatory controls? If so, what areas will go uncontrolled, and what will be the impacts on downstream water resources?

12055 Government Center Parkway
Fairfax, Virginia 22035-5511

Telephone(703)324-1100 Fax(703)324-1450

Mr. Leonard Alfredson, PE
Project Manager
WMATA Office of Extensions
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Alfredson:

Please find below Fairfax County staff comments on the Preliminary Scope of Work for the Dulles Corridor Rapid Transit Project (DCRPT). This letter incorporates comments from the Department of Transportation and the Department of Planning and Zoning.

General

1. This project is located in a corridor with significant development activities and ongoing changes to adjacent uses and rights-of-way. Data collection and coordination will need to be a continuing effort, since existing conditions will be changing throughout the project. Proffer commitments and developments with various stages of approvals may have a significant effect on potential right-of-way costs. These will need to be monitored closely as the project progresses.

Schedule

2. County endorsement of the DEIS and FEIS should be listed as a separate PE/NEPA activity prior to CTB/DRPT, WMATA, and MWAA approvals.

County Comprehensive Plan

3. The Comprehensive Plan contains the following elements in the Tysons Corner area:
   - -Widen Route 7 to 8 lanes from the Dulles Toll Road to I-495
   - -Widen Route 123 to 8 lanes from Route 7 to I-495; 6 lanes from I-495 to the Dulles Toll Road connector
   - -Widen International Drive to 6 lanes from Route 7 to Route 123

Provide interchanges at: Route 7/Route 123 (improved)
I-495/Route 123 (improved)
Route 7/Westpark
Route 123/International Drive
Route 7/International Drive

4. In addition to these planned road improvements, there are pedestrian facilities recommended in the Comprehensive Plan both in the Tysons Corner Urban Center and the Reston-Herndon Suburban Center plan text. Also, the Board of Supervisors has directed that on-pavement bike facilities be considered where appropriate.

5. We are requesting that WMATA work with VDOT and Fairfax County to develop conceptual designs (to about a 15% design stage) for the interchanges cited above in conjunction with the preliminary engineering for the DCRTP in order not to preclude their future construction.

6. Some conceptual design work may also be necessary for collocation of aerial alignments in Tysons Corner. Available roadway plans are not at the level of detail implied in Section 5.25.1.

Right-of-Way

7. In several locations, existing service drives are not located within VDOT right-of-way. It should be noted that additional right-of-way may be required for the proposed transit project and/or future road widening projects.

Modeling/Forecasting

8. Task 5.23 indicates that WMATA has engaged MWCOG to conduct transportation models and references "Scoping Clarifications." These are not evident and the meaning and effect of this reference are not clear.

9. In addition, it is stressed that the development of travel forecasts at the scale implied by the scope will require the preparation of detailed land use forecasts and the execution of complex travel forecasting models. Significant time is normally required to perform these activities. A more detailed schedule which sets forth the time requirements for preparing this data and executing these models should be distributed to local staff who may be involved in the preparation of the input for these activities.

10. Task 5 appears to be scheduled for completion by January 10, 2001. It is presumed that the Technical Memorandum (Task 5.24) describing the methodology and findings of this analysis will be available by that date. It is critical that this information be available in order to fully evaluate the analysis. 6.7.1

11. An explanation should be provided as to how the one-way stations in the T-2 alignment will be modeled versus how two-way stations are modeled. 6.7.1

12. For the BRT/Metrorail alternative, a comparison of travel time should be provided between Reston/Herndon and the urban core for: a) BRT with a transfer at Tysons-West and b) BRT with a transfer at the West Falls Church - VT/UVA Metrorail Station. 6.7.1

13. At the Pre-Scoping meeting, WMATA staff indicated that the 1988 Development-Related Transit Ridership Survey will be used for preparing estimates of the amount development-related travel which will be captured by transit. The Department of Transportation possesses surveys from 1987 and 1989. Only a small percentage of the office and residential sites surveyed in those two reports were located outside the Beltway; therefore, it is suggested that caution be used in applying this data to the Dulles Corridor Rapid Transit Project EIS analysis.

Alignments

14. The following variations in the alignments proposed for study may warrant additional analysis at this stage of the project:

- Provision of a more direct connection to the Orange Line to and from the west 6.3.1 6.3.4
- Variation of T-1 alignment that is aerial with a fourth station at Pike 7 Plaza.

15. Alignment T2 requires passengers to transfer in one direction. Ways to minimize the travel time impacts associated with the T2 alignment should be considered. 6.3.4

Related Studies

16. In addition to the related studies listed, the following should be added:

HJR 276 – Tysons Area Transportation Projects
Seante Document 35 – Transportation Improvements for the Reston Area 6.7.4

Editorial Notes

Page 9: BC1 (EB Travel Lane of Connector Road) should be considered an "as built" condition as it will be constructed in 2000.

Mr. Leonard Alfredson

Page Four

Page 63: Property Identification Plans , " a parcel numbering system will not be employed." We assume that since the County tax maps are being used as the base, the County's parcel numbers will be shown on these plans as they should be.

The County looks forward to working with you on this important project and advancing it in the most expeditious manner possible. Please do not hesitate to contact us for any assistance we can provide. Thank you for the opportunity to comment on this scope of work.

Sincerely,

RE: Dulles Corridor Rapid Transit Project – Comments on DEIS

Dear Mr. Hill:

The Fairfax County Park Authority (FCPA) has reviewed the Draft Environmental Impact Statement (DEIS) and offers the following comments:

1. FCPA comments on the NEPA EIS Scoping Process were provided on August 15, 2000. These comments stated that FCPA favors the rail alternative for the Dulles Rapid Transit Project. FCPA continues to support this alternative as the best alternative for improving regional transportation options, enhancing public accessibility to parkland and long term protection of Park resources. Further, our previous comments, a copy of which is attached, identified potential areas of impact to FCPA-owned properties. The impacts to FCPA properties are relatively similar for each alternative and have been adequately identified in the DEIS.

2. Areas of cultural and historical resources were identified in the DEIS primarily based on information provided by the State Historic Preservation Officers (SHPO). To augment the information provided by the SHPO, we have attached an archeology impact assessment, analysis and recommendations from the County Archeologist and FCPA Cultural Resource Protection Group. Please note that the County Archeologist has offered to assist in any archeological work that may be undertaken.

3. FCPA reiterates its concerns that trail crossings within Stream Valley Parks adjacent to the transit alignment be included in design efforts. Further, connections from existing and planned trails to the planned stations should be designed to enhance station access. Accommodations for pedestrian and bicycle access and trail connections should be coordinated with FCPA and the County trails planner and incorporated into right of way acquisition and rail alignment planning and development.

4. Potential partnerships with FCPA to incorporate park and recreation related amenities at station locations should be explored. As mentioned in our previous comments, features such as green space, landscaping, picnic tables, cultural or natural resource interpretive areas or open space design with fountains or other elements creating a sense of place should be explored.

Thank you for the opportunity to provide input into this important transportation study. If you have any questions regarding these comments, please contact Sandy Stallman, Long Range Planner, at (703)324-8643 or by e-mail at sstall@fairfaxcounty.gov.

Sincerely,

Lynn S. Tadlock, Director
Planning and Development Division

Fairfax County Park Authority

MEMORANDUM

07 August 2002

TO: Michael Rierson
Park Operations-Resource Management Division

FROM: John Rutherford,
Cultural Resource Protection Group

SUBJECT: Archaeological Assessment of Dulles Rapid Transit Corridor

The Cultural Resource Protection Group (CRP) of the Fairfax County Park Authority has reviewed the alignments for the Dulles Rapid Transit Corridor. Construction along this corridor will impact six parks owned by the Fairfax County Park Authority. The parks included in this assessment are Scott's Run, McLean Hamlet, Ashgrove, Difficult Run, Olney and Hutchison School Site. A number of important archaeological resources were found to exits in these parks. A full list of all Cultural Resources in the corridor was provide by County Archaeological Services and was detailed in a memo by Mike Johnson, County Archaeologist, dated 04 August 2002.

The Cultural Resource Protection Group has reviewed this memo and concurs with its recommendations. Important sites found within the parks include 44FX 2470 (Odrick Site), 44FX1597 (Ashgrove and other related sites, including 44FX2205 and 44FX2203). The CRP recommends complete avoidance of these sites. All of these sites are important to the history of Fairfax County, and as such, deserve special attention.

As noted on the figures from County Archaeological Services, areas of moderate or high potential for archaeological sites should also be surveyed prior to any construction.

Feel free to contact the Cultural Resource Protection Group, if you have questions or comments.

Cc Richard Sacchi- Cultural Resource Protection Group;
Mike Johnson- County Archaeological Services

Fairfax County Park Authority

MEMORANDUM

August 4, 2002

TO: Michael Rierson, Manager
Resource Stewardship Section - RMD

FROM: Mike Johnson, Archeologist
Fairfax County Archeological Services - RSS/RMD

SUBJECT: Dulles Corridor Rapid Transit (DCRT) project archeological resource assessment

Table 1 (assessments), Figure 1(map index) and the attached annotated ortho-photography maps are forwarded as requested. The assessments in Table 1 reflect approximately 25 years of program experience and acquired archival data on the DCRT area.

It is understood that significant portions of construction will be confined to the current Dulles Access and Toll Road corridor. As such many of the attached recommendations will be irrelevant to this project.

However, they are provided with the understanding that with projects of this nature construction staging areas are often used outside the right-of-way. Often these do not appear on the construction plans and requests for comment but should be treated as a part of the construction.

No comments were provided on areas that had already been developed. Remarks/recommendations concerning particularly sensitive areas are highlighted in bold under the "Remarks" column in Table 1.

From the standpoint of this office, site 44FX1569 is of particular interest from an overall resource planning perspective. The site was subjected to a phase 2 assessment in the 1980s. The results were conclusive from a functional standpoint but without chronological data the functional data is largely worthless. To justify the phase 2 cost to the public this situation should be rectified.

I urge the oversight agencies to build additional phase 2 testing or construction monitoring into the plans for the any construction that will destroy this site. Arrangements can be made with FCAS for this archeological work.

Please let me know if you have any questions or need additional information

Table 1. FCAS archeological resource assessments for the Dulles Corridor Rapid Transit Project.

Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Re: Dulles Corridor Rapid Transit Project – Comments on NEPA EIS Scoping Process

To Whom It May Concern:

Representatives from the Fairfax County Park Authority (FCPA) attended several of the scoping meetings and we offer the following comments for inclusion in the NEPA EIS project evaluation process:

1. Build Alternatives- Construction of an alternative mass transit system will reduce the long term transportation and environmental impacts to Park Authority Parks and Resources. Therefore, Build Alternative #3 (Construction of Metro Rail for the full length of the Dulles Corridor, between the Orange Line and Route 772) would be the desired alternative with respect to enhancing public accessibility to parkland and long term protection of Park resources.

2. Parks and Recreation Planning Strategies – The Park Authority would like to be included in a planning process, which could incorporate open space, and recreational planning initiatives into design of the proposed build alternative. During the Loudoun County scoping meeting, a citizen made the suggestion that commercial ventures be designed and included within the rail stations. This could possibly include small convenience stores, dry cleaners, snack shops or restaurants. We thought that this was an excellent idea and would like to expand on this idea by including incorporation of park and recreational facilities. This could include at a minimum green space, landscaping features, open space design with fountains or elements creating a sense of place. Minor recreational facilities such as checkerboard tables, picnic tables, etc. should definitely be investigated. In addition, it is recommended that formal recreational facilities be incorporated into the design. This could include multiuse courts; walkway connections to planned park trails, cultural/historical interpretative stations, etc.

3. Environmental Concerns- The FCPA has a number of environmental concerns relating to construction of the future rail lines, stations, and ancillary facilities. The actual construction of these systems may result in significant environmental impacts downstream and in Park property located in the immediate vicinity of the railway. The following are specific concerns:

- Biological Resources – Sedimentation from construction activity can have a significant impact on the downstream biological ecosystems and habitats. Mitigation measures beyond the standard erosion and sediment control construction practices need to be investigated.
- The Park Authority owns several significant stream valley parks, which are located, downstream of the construction. These are Sugarland Run, Difficult Run, and Scotts Run Stream Valley Parks. Construction impact mitigation measures need to be used to prevent degradation of park resources during project construction.
- Emergency plans should be in place for potential hazardous material spills or discharge from the construction area or future ancillary facilities.
- Any construction project of this magnitude will have any impact upon the watershed infrastructure both during construction and overtime. This impact needs to be studied thoroughly to prevent degradation of park resources.
- The potential location, type, and effectiveness of any associated stormwater management facilities needs to be investigated.
- There are recorded archaeological sites adjacent to the rapid rail corridor. Some of the sites are located within the park property and some are not. A cultural resource survey should be undertaken and mitigation of any disturbed cultural/historical artifacts. If the land has not been previously disturbed by development, there may be potential for recovering artifacts just prior to construction.

4. A significant amount of park resources in the form of stream valleys and drainageways to preservation areas are located downstream of the proposed development. The impact to these areas needs to be fully investigated and mitigated. The most significant natural resource and stream valley parks located downstream of the development include:

6.4.6

   - Lake Fairfax Park
   - Scotts Run Nature Preserve
   - Difficult Run Stream Valley Park
   - Scotts Run Stream Valley Park
   - Sugarland Run Stream Valley Park

5. The location of any ancillary facilities such as the bus maintenance depot, rail yard, power substations and tie breaker stations should be proposed at this time. These areas would encompass a relatively large area and could have an impact on parkland or a significant feature in the community. 6.4.3

6. The Fairfax County Comprehensive Plan calls for continuous trail connections within designated stream valley areas. The Park Authority is in the process of planning and engineering for construction of key segments of the stream valley trails. There are several locations where the stream valley trails will cross the rapid rail alignment. Overpasses or underground trail connections will need to be provided to insure the integrity of the trail

connectivity. Planned connections as shown on the Fairfax County Comprehensive Plan are in the following locations:

- The Scotts Run Crossing with Route 123
- The Wolftrap Run Crossing with Route 267
- The Difficult Run Crossing with Route 267

In addition to those shown on the Comprehensive Plan, potential crossings are located as follows:

- Courthouse Spring Branch with Route 267
- Sugarland Run with Route 267

A pedestrian crossing plan will need to be developed and reviewed by the Fairfax County Park Authority as part of the EIS process.

If you have any questions regarding these comments, do not hesitate to contact me at (703)324-8725 or by e-mail at Karen.Lanham@co.fairfax.va.us.

Sincerely,

Karen H. Lanham

Mr. Karl Rohrer, Project Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Rohrer:

Loudoun County wishes to enter the following statement in the Public Record in connection with the Dulles Corridor Rapid Transit Project.

County policies identify the Dulles Corridor Rapid Transit Project as one of the County's priority transportation projects. "This project is considered particularly important for the County's transportation system as it provides important surface transportation links to Dulles Airport and offers convenient commuting opportunities for County residents as well as employees who travel from neighboring jurisdictions to employment centers in the Dulles Greenway corridor". (Revised Countywide Transportation Plan). The County needs this project to reduce congestion levels on major roadway connections to Fairfax County and the Region's core and to stay within the Washington Metropolitan Area's emissions budget and satisfy the requirements of the Clean Air Act. The County has demonstrated its commitment to the project by identifying a local funding match in the adopted Capital Improvement Program.

The County's Smart Growth strategy is to encourage compact, pedestrian-friendly development in the east supported by well-functioning transportation systems. The Revised General Plan supports compact, high-density nodal development around proposed rail stations to limit sprawl and reduce public costs. The plan identifies a Transit-Related Employment Center (TREC) at the proposed Route 606 Station and a Transit-Oriented Development (TOD) at the proposed Route772 station. The TREC is planned for concentrated employment use or Special Activity use while the TOD is planned for a mix of high intensity land uses ranging from high-density residential uses, regional offices, entertainment and cultural centers, and other business and support services. Both transit nodes are planned for increased densities when rail transit and facilities are planned, scheduled, designed, and fully funded. The Moorefield Station TOD and the Loudoun Station TOD applications were approved.

In addition, the Revised Countywide Transportation Plan describes how the County intends to serve the mobility needs of the growing populace: "As the County's population has grown at its unprecedented rate over the past decade, residents, employees, and visitors are increasingly feeling the strain on the County's transportation system". The Washington Metropolitan Area's designation as a severe non-attainment area for ozone pollution under the Clean Air Act makes it imperative that multi-modal transportation planning be a part of the County's overall transportation strategy. This

Chuck Harris, Broad Run District
J. Drew Hiatt, Dulles District
Jim Burton, Mercer District
William Bogard, Sugarland Run District

printed on recycled paper

strategy includes "steadily increasing the prioritization and allocation of resources to the development of public transportation services, especially rail in the southeastern end of the Dulles Greenway corridor".

The Dulles Corridor Rapid Transit project is of utmost importance to Loudoun County and is critical to the future adequate functioning of the transportation network. Growth patterns envisioned in the Comprehensive Plan are dependent on the project. As such, it is essential that the Locally Preferred Alternative (LPA) move forward. The LPA consists of 11 stations, 5 of which are in Phase 1 and the remaining in Phase 2. If the LPA were to be delayed or abandoned, market forces rather than comprehensive planning would determine the future land use of Loudoun County.

Economic reality in Federal appropriations may require that the project be divided into two phases, but it must be viewed as one project. It should be noted that Loudoun County has put in place funding mechanisms to fully fund its share of the project. There has never been any doubt as to Loudoun's financial commitment to this project either with the original single project or the currently proposed two-phase project.

Loudoun County takes strong exception to the statement in the Executive Summary, "FTA had determined that the first phase now being considered for the funding has independent transportation utility even if the subsequent phase is never built." (p. s-3) To terminate this project at Wiehle Avenue would undermine land use policies of neighboring Fairfax County, and would forever condemn the economic future of one of the premier development corridors in the United States.

The most pressing issue is the need to complete the full Locally Preferred Alternative (LPA) by the current scheduled date of 2015. There are those who would oppose this on the grounds of cost and number of riders served. This is based on the false assumption that Bus Rapid Transit (BRT) can handle the future transit needs of the Dulles Corridor. The use of BRT in lieu of rail takes on some apparent credibility when viewed in the strict context of Environmental Impact Analysis. The analysis year of the EIS is 2025, with phase 2 not operational until 2015. It is shortsighted to measure a system that will last a century by what it will deliver in a decade.

In summary, Loudoun County strongly endorses this project. It is vital to our future economic success, the management of traffic congestion, improved air quality and will be a major determinant of how we mature as a region.

We are pleased to have the opportunity to submit these comments.

Sincerely,

Scott K. York
Chairman

RECEIVED
AUG 14 2002
By 16,162

0240 F

Thank you very much.

MR. KLINGE: Thank you, Delegate Plum. And now we have Bill Bogard, member of the Loudoun County Board of Supervisors. Welcome.

STATEMENT OF BILL BOGARD

MR. BOGARD: Thank you, Mr. Chairman, members of the panel.

Before I get started tonight, I would like to note that we have been joined by Supervisor Harris from the board of supervisors. I think he was absent a little bit earlier when we were doing introductions.

On behalf of the Loudoun County board of supervisors, I am pleased to have this additional opportunity to provide comment on the Dulles corridor rapid transit project and the draft environmental impact statement.

Previous to this evening's hearing, we, Loudoun County, have offered specific technical comments in a letter to Mr. Dittmeier dated April the 18th, 2002. Thus, tonight I will offer only comments of a general nature.

Loudoun County's revised comprehensive plan carries forward the central concept that development should be systematic in compact communities and in the right location in order to function well and enable the county to provide adequate and cost-efficient public services.

In the western part of the county, the plan provides for a strengthened rural economy, while reducing residential densities. In the eastern part of the county, the emphasis has been to reinforce the match between infrastructure and planned land use, creating communities that are distinct, well designed and well serviced. This is smart growth to which we are fully committed.

A major element of this smart growth strategy is the Dulles corridor rail project, and our land use policies are specifically structured to maximize the benefits and the opportunities presented by the Dulles corridor rail project stations at both Route 606 and 772.

The county plan also recognizes that we must look toward options to the automobile to

satisfy our transportation needs. We have taken major steps to expand our transit and ridesharing services and will continue to do so to meet the needs of our citizens and to provide viable options to the automobile.

Loudoun County stands ready to support its share of this project financially and has a funding mechanism to accomplish this. We are concerned that other funding may not be available on the originally proposed schedule and strongly urge that all means necessary be taken to put a funding plan in place that will deliver this project on its current schedule. This project is too important to allow it to be delayed.

A savings in both time and funding that could be achieved on this project is the elimination of the bus rapid transit phase and going directly to rail. While BRT initially may have had certain advantages, such as a favorable Federal funding ratio, this is no longer the case. To include BRT may also have the added disadvantages of increasing the project's overall

cost and, perhaps most importantly, it would present significant operational problems if you were to build the rail line while keeping BRT operational.

Frankly, we do not see the cost justification and operational advantages for building BRT over maintaining or enhancing bus services that Loudoun County and others currently operate in the Dulles corridor.

With respect to the rail yard options, we are opposed to yard site 7 and 20 and favor yard site 15. Site 15 meets all of the Washington Metropolitan Area Transit Authority requirements and allows sites 7 and 20 to be developed as envisioned in the county's comprehensive plan. In time, these properties will contribute to the WMATA customer base.

In conclusion, we offer our strongest support possible for the extension of the WMATA metrorail system into Loudoun County. We are prepared to participate financially and have developed our land use policies to maximize the

value of the system.

Thank you.

MR. KLINGE: Thank you, Mr. Bogard.

And now I will turn the introductions over to Supervisor Dana Kauffman.

MR. KAUFFMAN: Thank you, Mr. Klinge.

I will be calling speakers three at a time, to give you folks time to proceed closer to the podium to help us move the proceedings along.

Our first speaker is Thomson M. Hirst, to be followed by Robert E. Buchanan and Patricia Nicoson.

STATEMENT OF THOMSON M. HIRST

MR. HIRST: Good evening. My name is Thom Hirst, and I live and work in Reston. In addition to my day job, which is in commercial real estate, I started the Rapid Transit Action Committee or RTRAC, which was formed to research and promote cost-efficient ways to provide better rapid transit now, not 10 to 15 years from now, but now, and at a cost we can afford.

Everyone agrees that we need rapid

Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Re: Dulles Corridor Rapid Transit Project – Public Hearings Report (Docket Number R03-6)

Dear Mr. Rohrer:

Thank you for the opportunity to comment on the above referenced report.

General Comments:

- We wish to reiterate our previous comment questioning the evaluation of alternatives using a 2025 forecast horizon year. Results for the full LPA should use a broader forecast horizon year given that the full build LPA would be in operation by 2015. County staff does not feel that a 10-year forecast horizon provides an adequate picture. The response contained in the Public Hearings Report provides that 2025 is the forecast horizon year used in the Draft EIS and Supplemental Draft EIS because it allows for a comparison between the proposed alternatives in a future year in which they would have achieved their full potential. While 2025 as a forecast horizon year for the Draft EIS may have been appropriate, County staff do not feel this is the case for the Supplemental Draft EIS. The Draft EIS did not anticipate the Locally Preferred Alternative being developed in two phases. Additionally, the Draft EIS anticipates the Locally Preferred Alternative being operational in 2010. The Supplemental Draft EIS anticipates the Locally Preferred Alternative being developed in two phases with phase 2 being operational in 2015. County staff believes that these differences necessitate that a different forecast horizon be used when evaluating the alternatives in the Supplemental Draft EIS.

- The term "Premium Bus Service" still causes us concern. While we appreciate your email of February 17th on this subject, we still have concerns where the report speaks to this issue. We need to fully address the concept of Premium Bus Service. The report has a limited definition on page 106, but to us this sounds very much like the service we are now providing.

printed on recycled paper

- It should also be noted that in your operating plan for Phase 1 we feel it would be much more advantageous to build commuter parking at the future Rt. 772 station than to expand parking at Dulles North, where we currently have several hundred excess spaces.

Specific Comments:

- P 45
  Comment 0016
  Passengers will not be required to transfer to "Premium Bus Service" at the Rt. 606 station. Response should state Loudoun County is currently running service to Leesburg and that such service will continue. The wording in the Report appears to contradict your above referenced email.

- P 104
  Comment 0107
  "Capital Costs for Premium Bus Service are included in the projects capital cost estimate". Please define statement. What are the items covered in the estimate, and what is the amount for each?

  Comment 0061
  "The premium bus service will replace express bus service currently run by Loudoun County into Roslyn and Downtown Washington". This is an incorrect statement. While we appreciate your email on this subject, this still needs to be corrected in the final document.

If you have any questions on these comments, please contact John Clark for clarification.

Sincerely,

Kirby M. Bowers

Re: Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation, Dulles Corridor Rapid Transit Project (Hearing No. 160, Docket R03-6)

Dear Mr. Ellis,

Thank you for the opportunity to comment on the above referenced project. The Revised Countywide Transportation Plan (CTP), adopted on July 23, 2001, identifies the Dulles Corridor Rapid Transit Project as one of the County's and Region's priority transportation projects (CTP, text, p. 2-3). Additionally, the County's Revised General Plan policies encourage transit-supportive development at planned transit nodes (Revised General Plan, pp. 6-22 to 6-27).

The County' s Bicycle and Pedestrian Mobility Master Plan (Bike/Ped Plan) was adopted on October 20, 2003. Please note that this document outlines policies establishing the need for high quality bicycle and pedestrian access to the future transit stations (Bike/Ped Plan, Transit and Demand Management Policies, p. 35). The County wishes to ensure that well designed bicycle and pedestrian access will be provided through the transit stations providing access to development on both sides of the Greenway. The County wishes to be a consulting party as the design program is further developed.

I have outlined by section and topic my comments below:

Section 1.3 Planning Context: Paragraph 2 notes the Countywide Transportation Plan this should be changed to the Revised Countywide Transportation Plan (2001).

Section 1.3 Planning Context: It should be noted that the Revised General Plan allows for up to 50 dwelling units per acre when rail transit and facilities are planned, scheduled, designed and fully funded to serve the area designated as a Transit-Oriented Development (TOD) (Revised General Plan, Policy 12c, p. 6-25). The TOD is located between the Loudoun County Parkway and Route 772 interchanges (Revised General Plan, text, p. 6-22). The transit node proposed for the Route 606 station is planned for a Transit-Related Employment Center (TREC), planned for concentrated employment use or Special Activity destination

(Revised General Plan, text, p. 6-22). Residential development is not permitted within the TREC due to the constraints of the Dulles Airport 65 Ldn, the Dulles North Transit Center, and the importance of preserving the natural environment (Revised General Plan, text, p. 6-22).

Section 1.3 Planning Context: The last sentence on page 1-7 should be edited to read "The *Loudoun County Revised Countywide Transportation Plan* also includes public support for transit services that would use the corridor, such as carpools, vanpools, bus and rail services, and other alternative modes, with specific funding support for bus services".

Section 2.2.4: Comparative Evaluation of Alternatives: County staff questions the evaluation of alternatives using a 2025 forecast horizon year. Results for the full LPA should use a broader forecast horizon year given that the full build LPA would be in operation by 2015. County staff does not feel that a 10 year forecast horizon provides an adequate description.

Section 3.1 Land Use: The total amount of development for Moorefield Station in this section is incorrect. Moorefield Station was approved for 10,750,000 square feet of non-residential development and 6,750 residential units.

Section 3.1.1.2.B. Proposed LPA Phase I: It should be noted that the Revised General Plan also supports the extension of rail facilities to the Dulles Airport (Revised General Plan, text, p. 4-8). Therefore, the proposed LPA Phase 1 is not consistent with the Revised General Plan because it would not provide rapid transit to Dulles International Airport and the Route 606 and Route 772 station areas.

Section 3.2.1.2.B. Proposed LPA Phase I: County staff asks that the first sentence on page 3-20 be clarified. "If the proposed LPA were not constructed in its entirety by 2025, neighborhoods located west of the Wiehle Avenue station area would not receive mobility benefits from access to Metrorail service during the proposed LPA Phase 1." Metrorail service is not planned to extend west of Wiehle Avenue as part of proposed LPA Phase 1.

Section 3.4 Visual and Aesthetic Conditions: This section states that a site plan has been approved for the Moorefield Station development. This statement is incorrect, the rezoning has been approved for Moorefield Station however, no site plans have been approved at this time.

Section 3.5 Cultural Resources: The County should continue to be a consulting party as impact mitigation strategies are discussed. Additionally, the Area of Potential Effect (APE) was defined as 200 feet beyond station footprints to allow for possible variation during construction. The County should be contacted if variations to the proposed alignment will impact additional sites.

Please forward a copy of the Programmatic Agreement from the State Historic Preservation Officer (SHPO) to:

Loudoun County Planning Department
c/o Marie Genovese
1 Harrison St., S.E., 3rd Floor
P.O. Box 7000
Leesburg, VA 20177-7000

Section 3.6.3 Mitigation: The document states that temporary construction impacts at the Moorefield Station recreation center and athletic fields will be mitigated, but does not provide any information as to how impacts will be mitigated.

Section 4.1.1.2A Proposed Full LPA: The total amount of development for Moorefield Station in this section is incorrect. Moorefield Station was approved for 10,750,000 square feet of non-residential development and 6,750 residential units.

Section 4.2 Water Resources: The County's Revised 1993 Zoning Ordinance was adopted on January 6, 2003 implementing many of the policies outlined in the Revised General Plan. The River and Stream Corridor Overlay District (RSCOD) was established with the revisions to the Zoning Ordinance (Section 4-2000). River and Stream Corridor Resources include:

a. "Rivers and streams draining 100 acres or more.
b. 100-year floodplains (including major and minor).
c. Adjacent steep slopes (slope 25 percent or greater, starting within 50 feet of streams and floodplains, extending no farther than 100 feet beyond the originating stream or floodplain).
d. 50-foot Management Buffer surrounding the floodplains and adjacent steep slopes.
e. Wetlands, forests, historic and cultural resources, and archaeological sites that fall within the area of one or more of the above elements" (Revised General Plan, Policy 2, p. 5-6).

Additionally, a 300-foot no-build buffer or the RSCOD, whichever is greater will be applied to scenic rivers, the Potomac River, the Bull Run, and the protected shoreline of drinking water reservoirs (Revised General Plan, Policies 1, 8, & 11, pp. 5-11 & 5-17). Please ensure that all the elements of the RSCOD have been taken into account when determining impacts to water resources.

Section 4.2.3 Mitigation: Coordination with local jurisdictions regarding mitigation for the nonconformity of any project elements within critical areas is listed as an available option. County staff considers this to be a requirement for any element of the project that impacts the RSCOD.

Section 4.2.3 Mitigation: The County supports the federal goal of no net loss to wetlands and will identify optimum receiving sites with a priority given to each geographic Policy Area (Revised General Plan, Policy 23, p. 5-8). Therefore, the County prefers any wetland impacts incurred in Loudoun County from the proposed project be mitigated within the Suburban Policy Area. However, if a wetland mitigation bank is not available within the Suburban Policy Area at the time the impacts are incurred County staff prefers that impacts to wetlands within Loudoun County be mitigated at the Bull Run Wetland Bank as shown on Figure 4.2-2.

Section 9.2.1.2B. Proposed LPA Phase 1: This section states that changes in land use under the proposed LPA and proposed LPA Phase 1 would be most dramatic in Loudoun County, where land use that is currently rural in nature would be converted to mixed-use suburban centers. It should be noted that the proposed alignment for the Dulles Corridor Rapid Transit Project is located in the

Suburban Policy Area as defined by the Revised General Plan and is planned for suburban-scale residential and non-residential development (Revised General Plan, Chapter 6).

County staff anticipates the Board of Supervisors to adopt a Resolution regarding the proposed project on December 15, 2003, at which time it will be forwarded to the Department of Rail and Public Transportation to be added to the public record.

If you have any questions regarding these comments please contact Marie Genovese, Planner in the Department of Planning at (703) 777-0246.

Sincerely,

Kirby M. Bowers

December 20, 2002

RECEIVED
DEC 26 2002

Ms. Karen Rae
Director of the Virginia Department of Rail and Public Transportation
Virginia Department of Rail and Public Transportation
1313 E. Main Street, Suite 300
PO Box 590
Richmond, Virginia 23218-0590

Dear Ms. Rae:

I am pleased to forward to you a copy of the Loudoun County Board of Supervisors Endorsement of Metro Garage Parking at the Route 772 Rail Station north and south of the Greenway. The Board's action, taken on December 2, 2002, also directed me to provide a letter to VDRPT referencing the Board's Endorsement of a Metro Garage Parking including the steps the County is taking to achieve consistency with County Transit Oriented Development (TOD) policies. Attachment 1 is a copy of the Board's Endorsement.

The County has been coordinating with WMATA on issues related to bringing Metrorail Service through the Dulles Corridor to Loudoun stations. A WMATA analysis undertaken as part of the NEPA process shows an unconstrained parking demand of 3,300 parking spaces at the Route 772 station. This issue has become part of the County's review of two high density transit oriented developments north and south of the station. The two developments are seen as providing resources for Metro Garage Parking as well as a Transit Connector Bridge running across the Greenway between the projects.

The first development, Moorefield Station, was approved by the Board of Supervisors on December 16, 2002. It is the largest mixed use development in the history of Loudoun County and will be a rich source of future patronage for the Metrorail System. The final proffer package includes twelve acres of land adjacent to the station dedicated to station land uses. An additional 3.6 acres will be dedicated for a conveniently located Metrorail Parking Garage. This site is proposed to provide approximately half of the necessary 3,300 parking spaces identified by WMATA. The proffers also provide for a network of multi-modal urban roads connecting the planned road network for Loudoun County with the Route 772 Station. Finally, the proffers provide funds for a portion of the cost of the Transit Connector Road.

We are also negotiating with developers north of the Greenway to provide land dedication for the remainder of the necessary 3,300 parking spaces. Loudoun County hopes to achieve this objective next year. The bottom line is the NEPA analysis did not assume any of these spaces would be provided at e Route 772 Station Their provision will likely result in this station being the fourth highest generator of passenger loading on the Dulles Corridor Rail Line, out of thirteen stations, in a 2025 time frame. Only one of the Tysons Stations will have higher forecasted daily boardings.

We need VDRPT's help to realize the full benefits of this progress. Loudoun County is asking at this time that the facilities necessary to accommodate the forecasted WMATA demand be incorporated into the Project and that cost of such facilities be treated as project costs. Specifically these facilities are garage parking for 3,300 vehicles and a vehicular bridge over the Metro tracks connecting the north and south parking garages at this station. We view the provision of these facilities as necessary to achieve the full beneficial results of the Metro Rail system, both to Loudoun County, but perhaps more importantly, to the region. If we do not accommodate demand at its origin, it will find alternative means of travel which may be detrimental to our Region's air quality and congestion management goals.

If you have any questions concerning any of the material in this letter, please contact John Clark, Director, Loudoun County Office of Transportation Services at 703-737-8514 or jclark@loudoun.gov.

October 24, 2002

Mr. Cory Hill
Northern Virginia Regional Manager
Virginia Department of Rail and Public Transportation
PO Box 590
Richmond, Virginia 23218-0590

Dear Cory:

This is in reference to the Public Hearings Report for the Dulles Corridor Rapid Transit Project. We complement the Project team on this significant effort. We are pleased the Project Team concluded as we did that we should go directly to Rail and that site Y15 is best for the yard site.

We do have a significant issue at the Route 772 station that we need to bring to your attention. The issue is that of parking. WMATA analysis of unconstrained parking demand at this station has estimated a need for 3,300 parking spaces. It is our intention, subject to Board of Supervisors (BOS) approval, to address this demand.

We have been working with two major active land development applicants immediately adjacent to the station and made significant progress in identifying locations for parking facilities to accommodate this demand. It is our belief that metro-parking garages on both sides of the station connected by a transit connector bridge offers the best possible solution. We are in negotiations with the developers and believe that we can get dedication of the land necessary to accommodate these improvements at no cost to the project.

The land involved in these potential dedications is currently in the process of rezoning. We estimate a resolution of these rezoning cases by the BOS in the foreseeable future. Assuming favorable action by the BOS, we are asking at this time that the facilities necessary to accommodate the forecasted WMATA demand be incorporated into the Project and that cost of such facilities be treated as project costs. We view the provision of these facilities as being in addition to the parking already included in the project at the Route 606 station, recognizing that only through such actions will we achieve the full beneficial results of the Metro Rail system, both to Loudoun County, but perhaps more importantly, to the region. If we do not accommodate demand at its origin, it will find alternative means of travel which may be detrimental to our Region's air quality and congestion management goals.

Sincerely,

Kirby Bowers
County Administrator

Mr. Leonard Alfredson
Project Manager
Dulles Corridor Rapid Transit Project
1550 Wilson Boulevard, Suite 300
Arlington, VA 22209

Dear Mr. Alfredson:

Loudoun County appreciates the opportunity to present its comments on the Scoping Process for the Dulles Corridor Rapid Transit Project. We also thank you for the project presentation to the Board of Supervisors Transportation Committee on July 10, 2000 and the Public Scoping Meeting held at the Ashburn Elementary School on July 27, 2000. The comments received at the Public Scoping Meeting should be carefully considered before the final scope-of-work for the project is prepared.

Loudoun County requests that the following comments also be considered in preparing the final scope-of-work.

1. The location, design and costs for vehicle maintenance and storage facilities in Loudoun (BRT and Rapid Rail) need to be completed early in the study to facilitate land acquisition. 5.4.3

2. The Comprehensive Financial Plan for capital and operating costs will need to include significant federal and state elements so that the local jurisdictions are not faced with an unreasonable cost burden. 5.9.1

3. Loudoun County needs to be connected with key areas in the Fairfax County section of the Dulles Corridor such as Herndon, Reston and Tysons Corner by transit service. We will work with the project team and Fairfax County to implement this service. 5.3.

4. The early implementation of reverse commute transit service to Loudoun County is needed for rapidly growing businesses in Loudoun County. 5.2.

5. The extent and time frame for Bus Rapid Transit (BRT) service will need to be determined. Currently BRT is being considered for a 2003-2009 time frame, with rapid rail reaching Loudoun County in 2010.

6. Relationships between proposed levels/types of service and the land use densities required to support such service levels needs more detailed evaluation. 5.6.3

Loudoun County looks forward to its participation in the Dulles Corridor Rapid Transit Project and recognizes the importance of your efforts.

Sincerely,

Sanjeev Malhotra, P.E., AICP
Chief of Transportation

Arlington, Virginia 22209

RE: Dulles Corridor Rapid Transit Project, Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation Public Hearing Report

Dear Mr. Rohrer:

Montgomery County supports the Dulles Corridor Rapid Transit Project and offers our comments on the Public Hearing Report for your further consideration as the environmental review process continues leading to the Final Environmental Impact Statement.

In our original letter on the Supplemental Draft Environmental Impact Statement, we commented on the need to identify and incorporate the future Capital Beltway Rapid Transit System as it is envisioned in the Northern Virginia 2020 Transportation Plan and the Fairfax County Transportation Plan into the Dulles Corridor Rapid Transit System in the vicinity of the Capital Beltway and Tysons Corner. The Public Hearing Report acknowledged our request, but did not address the technical issues.

While we understand the Dulles Corridor Rapid Transit System is much further ahead of the Beltway Corridor rapid transit system, there is still a need and necessity to consider to the fullest extent possible how and where a Beltway Corridor rapid transit system will interface with the Dulles Corridor Rapid Transit System. Further, is it our understanding that the Commonwealth of Virginia recently examined potential Beltway Corridors and has additional information that may prove useful in the Dulles Corridor analysis that we are requesting. It is very unlikely that another public opportunity for planning system integration will occur in the Tysons Corner area.

Office of the Director
101 Monroe Street, 10th Floor • Rockville, Maryland 20850-2540 • 240/777-7170, FAX 240/777-7178
Located one block west of the Rockville Metro Station

What we are seeking is a graphical depiction of the general connection of the Beltway Corridor to the Dulles Corridor Rapid Transit System, so that in future years the figure in the Final EIS is a reminder and starting point for the facilities planning of that transfer facility. We are interested in this matter, since eventually the Beltway Corridor will extend into Montgomery County.

Thank you for the opportunity to respond to your Public Hearing Document. Please contact Gary Erenrich of my staff at 240-777-7170 if you have any questions.

Sincerely,

Albert Genetti, Jr.
Director

AND TRANSPORTATION

Albert J. Genetti, Jr., P.E.
Director

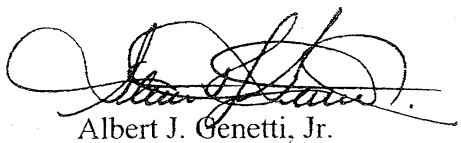
0092 21,319

December 16, 2003

Mr. Karl Rohrer
Project Manager
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Rohrer:

Montgomery County supports the Dulles Corridor Rapid Transit Project as outlined in the Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation. The Dulles Corridor Rapid Transit Project is consistent with regional planning processes at both the Transportation Planning Board in the Constrained Long Range Transportation Plan and at the Washington Metropolitan Area Transit Authority in the System Expansion program. The expansion of rapid transit benefits all of the region's residents and businesses and strengthens the overall Metrorail system. This project is consistent with our belief that the region's economic growth must be accompanied by a balanced transportation strategy including expansion of our transit and highway systems, technological improvements on our operations of the existing networks, and attention to alternatives to our current transportation modes.



Montgomery County envisions other rapid rail corridors and would like the Dulles Corridor Rapid Transit Project to be designed to facilitate the development of these other lines. Specifically, Montgomery County supports a future rapid transit corridor along the Capital Beltway connecting the Red Line in Montgomery County to the Orange Line in the Tyson's Corner area. The expansion of rapid transit along the Beltway is also consistent with the Fairfax County Transportation Plan and the Northern Virginia 2020 Transportation Plan. The Supplemental Draft Environmental Impact Statement should acknowledge this potential Beltway rapid transit corridor. The document should ensure that any of the Dulles Corridor Rapid Transit stations proposed in Tyson's Corner or at Dunn Loring on the Orange Line will not preclude a future integration of the regional system. It would be desirable that the Supplemental Draft Environmental Impact Statement addresses how a future Beltway rapid transit system could connect to the Dulles system including passenger transfers, station platforms, and vehicle layover. Right-of-way should be preserved at the proposed Dulles Corridor Rapid Transit Stations to accommodate the future Beltway Corridor system.

Office of the Director
101 Monroe Street, 10th Floor • Rockville, Maryland 20850-2540 • 240/777-7170, FAX 240/777-7178
Located one block west of the Rockville Metro Station

Montgomery County believes that the Washington Metropolitan Area Transit Authority Board should address the operating and maintenance cost sharing formula so that all member jurisdictions have a clear understanding of their financial responsibility for both phases of the project. The Dulles Corridor Rapid Transit Project is potentially a 23 mile extension to a 103 mile system for a 22 percent increase in the system size, and this large a system expansion should be thoroughly reviewed by the funding partners at WMATA. Such a review can then be used by all jurisdictions to guide future system expansions.

Montgomery County will continue to work with the project sponsors to address the issues that we raised in this letter.

Sincerely,

Albert J. Genetti, Jr.

RE: Docket Number R03-6.

Dear Mr. Rohrer:

This is in response to the Public Hearings Report on the Dulles Corridor Rapid Transit Project. The City of Falls Church remains concerned that the Supplemental EIS, issued in October 2003, and this subsequent Public Hearings Report contain no mention of traffic impacts at, and around, the East Falls Church Metro Station.

The East Falls Church Metro Station will be the last station on the Silver/Orange line, and will have a significant increase in service frequencies. We believe it is contradictory to assume, as the EIS does, that there will be no traffic impacts at, and around, this station.

The City's concerns were communicated to DRPT in a letter dated July 30, 2002, and included the commentary of an independent traffic engineer. These concerns were not addressed in the Supplemental EIS of October 2003. This omission was raised and repeated during our meeting on November 19, 2003, yet is not referenced in the Record of Public Hearings.

The Dulles Corridor Rapid Transit Project is a major and positive project for the region. The City of Falls Church, due to its location by the existing Orange line at the point of departure for the

proposed new line to Dulles, will be significantly impacted. We have expressed our reasonable desire to know the nature and extent of this impact.

Therefore, we take this opportunity to request once again that the EIS for the Dulles Corridor Rapid Transit Project must include a traffic impact study for the area around the East Falls Church Metro Station.

Sincerely,

F. Wyatt Shields

Subject: Public Hearings Report

Corey:

Thanks you for sending us a copy of the Public Hearings Report for the Dulles Corridor Rapid Transit Project. We have no comments on the impacts to the City's public utilities at this time. Please include us in the future as you circulate documents for review and comment or information. We would appreciate your sending us any plans, as the project progresses from concept through design, which would possibly impact our water system, which extends from the City to Tysons Corner.

Robert J. Etris
Public Utilities Engineer
City of Falls Church
703-248-5335 (phone)
703-248-5214 (fax)
571-238-6370 (cell)

in the interim.

Likewise, future planning needs to build upon the pioneering work already completed in Fairfax and Loudoun Counties to amend their comprehensive plans. That planning calls for rail stations with maximum access and flexibility for riders and transit-oriented development around the stations.

But for the decision before us tonight, that decision being the locally preferred alternative, the Dulles Corridor Rail recommends that we move to rail now.

Finally, I would ask that the record indicate that I used four minutes and 22 seconds of my 10 minutes.

Thank you.

MR. KLINGE: Thank you.

[Applause.]

MR. KLINGE: Now I'd like to introduce the mayor of the city of Falls Church, the Honorable Daniel E. Gardner.

STATEMENT OF THE HONORABLE DANIEL E. GARDNER

RECEIVED
AUG 09 2002
By 16,027
0164

MR. GARDNER: Good evening, Chairman Klinge and Chairman Hanley.

The city of Falls Church welcomes this opportunity to present concerns of the city to the Virginia Department of Rail and Public Transportation regarding the draft environmental impact statement for the Dulles Corridor rapid transit project.

Although supportive of the project, the city has some critical issues with regard to the EIS which we feel must be addressed before the project proceeds.

Generally we are concerned that although the city of Falls Church will be impacted by the project, our community overall has been overlooked in the EIS.

The impact area of the project includes the East and West Falls Church metro stations which are located on the perimeter of our city limits. We believe that the impact to the citizens and the environment of the city of Falls Church has neither been assessed nor mitigation measures considered or

developed. Specifically the city has the following concerns:

The draft EIS has failed to meet the legal requirements of environmental statement regarding significant impact analysis in particular areas as required by 40 CFR 1502.14 and 40 CFR 1508.9, including the city of Falls Church, which will be impacted by this proposed project.

The draft EIS has failed to fully assess water, traffic and transportation impacts on the city of Falls Church and thus fails to propose mitigation of those potential impacts.

The draft EIS has failed to adequately address issues of parking overflow in the residential areas adjacent to the East and West Falls Church metro stations.

The draft EIS has failed to adequately address public safety and infrastructure issues regarding pedestrian traffic, especially students conflicting with vehicular traffic in and around the West Falls Church metro station, given the prediction for increased vehicle trips per day.

Our middle school and high school are adjacent to that station.

The draft EIS has failed to address the environmental impact to surface and groundwater as it might affect the city's water distribution system that serves much of the corridor and Four Mile Run.

The city of Falls Church understands the legal requirements in the framework of the environmental impact statement, which is to assure that all issues, alternatives and concerns are weighed and evaluated for remedy.

In attempting to meet these specific requirements, we believe that mitigation of the project impact on the city of Falls Church and its immediate surroundings has not been sufficiently addressed.

We firmly believe this project will have a substantial vehicular traffic impact on the city as the East and West Falls Church metro stations transform into a major regional transportation hub in the future.

From the outset the city has been concerned that the project will bring thousands of additional motorists into the city, and urges that plans be made to accommodate the additional traffic. If these motorists drive to stations and cannot find parking, they will try to park on the residential streets, creating a significant impact on the surrounding neighborhoods.

The city has repeatedly requested that these impacts and others be anticipated and addressed.

The project, while appearing to be beneficial to the region, has a significant and direct negative impact on the city in a manner not fully analyzed in the draft EIS.

We have previously asked that this impact be thoroughly studied. However, we have now concluded it has not been given full consideration.

Overall, we strongly believe the draft EIS' lack of full analysis could prove disastrous for the city, the surrounding neighborhoods and our educational structures.

Moreover, we suspect there may be tremendous safety concerns if proper evaluations are not conducted. We believe our neighborhood streets will be inundated with motor vehicles and that the project will be considered a failure by our citizens.

Existing infrastructures will be adversely affected and must be effectively remedied by operational plans and new facilities.

While we may be critical of the EIS, and we are, we remain firmly committed to public transportation and recognize and accept that it is critical to the elimination of air pollution, minimization of vehicular transportation on city streets and in our neighborhoods.

Toward this end, section 10.3 of the draft EIS, entitled "Issues to Be Resolved," should be amended to include the issues raised by our written input.

The city council and I would appreciate your careful review and attention to these issues on behalf of all our citizens.

I would like to point out that our good neighbors in Arlington and Fairfax County also have these same issues in the area surrounding East and West Falls Church metro.

I will provide a complete copy to Mr. Hill, and I think we have mailed copies with full attachments as well.

Thank you very much for the opportunity to speak this evening, and we look forward to working with you in the future.

MR. KLINGE: Thank you, Mayor Gardner.

[Applause.]

MR. KLINGE: The next speaker is a member of the Falls Church city council, the Honorable David Snyder.

STATEMENT OF THE HONORABLE DAVID SNYDER

MR. SNYDER: Thank you very much, Chairman Klinge and Chairman Hanley, for this opportunity to be here this evening and to speak on this very important regional and local project.

Falls Church is a charter member of the metro system and so we take the issue of mass

I would like to point out that our good neighbors in Arlington and Fairfax County also have these same issues in the area surrounding East and West Falls Church metro.

I will provide a complete copy to Mr. Hill, and I think we have mailed copies with full attachments as well.

0165 F

transit very, very seriously and support it in every day that we can. I have an opportunity to do so personally as former chair of the Northern Virginia Transportation Commission and as a representative of the city of Falls Church on the Transportation Planning Board.

But the reality is that Falls Church is the eastern terminus of this project, regardless of which of the alternatives are followed. Our first set of comments, summarized by Mayor Gardner, really relates to the technical, legal and factual issues which must be adequately addressed for a draft EIS and an EIS to pass muster under the law.

Page 8 of the summary lists those in four categories:

Social effects; environmental effects; economic effects; and transportation effects.

We believe that at a minimum this project, regardless of its alternatives, has the following social effects:

Community cohesion; displacement and relocation; visual and aesthetic conditions;

parklands and recreation areas; and especially safety and security, especially regarding pedestrians and school students in the area.

Secondly, as Mayor Gardner indicated, there may be very significant water resources effect, air quality, noise, vibration, hazardous and contamination materials and other effects.

Third, in terms of economic effects, its unequal economic effect is something that deserves additional study.

Finally, transportation effects again are inadequately studied under this draft EIS. And they include effects on local and regional roadways, transit parking, and bicycle and pedestrian facilities. And we have a written submission, which we ask be a part of this record.

Now as a matter of law and as a matter of fact, we believe that additional work needs to be done, and that the draft EIS and any EIS that fails to address these issues would be inadequate and incomplete as a matter of law.

But what is more important here is that

unless these issues are addressed successfully, this will not be a project that works for the citizens of this region. We note that in the handout this evening that one of the objectives is to increase mobility and accessibility, and another key objective is to accommodate future increases in transportation demand.

We certainly now and in the past and will be in the future are committed to achieving those objectives along with our colleagues and those others who share the region with us. And yet unless the issues are addressed which we have outlined in our written submission and we have talked about this evening, this will be like a beautiful, attractive island surrounded by a sea of sharks that you can't get to.

In other words, what good is this transit system if you can't get to it? And you can't get to it unless you address systematically the neighborhood streets, the transit services that provide transportation, conceivably, to this important new addition to the region, and in

otherwise provide for a much greater area than is provided for now.

We know that the highways in the area that potentially would be accessed for this system are already significantly under stress and, frankly, break down regularly as effective transportation corridors. And those include Route 7, Route 29, Route 66, and many other neighborhood highways.

We recognize as well that there are significant pedestrian and school traffic throughout this area.

So for all the reasons indicated, we urge a much more significant study of the issues that we have talked about, that we urge inclusion of mitigating factors, and finally we urge that, not just for the citizens of Falls Church, but all the citizens of this potential region, because if it works for us, it will work for the region. If it doesn't work for us, it won't work for the region, either.

So with that, we would like to summarize by saying we appreciate the opportunity to be here,

we are absolutely committed to the objectives of increased mobility and accessibility, we are absolutely committed to mass transit, and we have shown it in every way possible. We do tonight and we will in the future, and we certainly want to accommodate future increases in travel demand more effectively than we have been able to in the past.

If we address the issues that we have outlined tonight, we believe that this project will achieve those objectives. If we don't, it fails as an EIS and it will fail as a project that serves the region.

Thank you very much.

[Applause.]

MR. KLINGE: Thank you, Councilman Snyder.

And now I am going to turn the meeting over to Ms. Hanley, who will introduce the people in the public who wish to testify. Ms. Hanley.

MS. HANLEY: Thank you, Mr. Klinge.

Let me ask one more time if you could join me, is there anyone who wants -- who requests signing services? Okay. Thank you.

Mr. Corey W. Hill
Northern Virginia Regional Manager
Virginia Department of Rail and
Public Transportation
1550 Wilson Blvd.
Suite 300
Arlington, VA 22209

Dear Mr. Hill:

The City of Falls Church welcomes this opportunity to present the concerns of the City to the Virginia Department of Rail and Public Transportation (DRPT) regarding the draft Environmental Impact Statement (EIS) for the Dulles Corridor Rapid Transit Project (the Project). Although supportive of the Project, the City has some critical issues with regard to the EIS, which we feel must be addressed before the Project proceeds. Generally, we are concerned that although the City of Falls Church will be impacted by the Project, our community overall has been overlooked in the EIS. The impact area of the Project includes the East and West Falls Church Metro Stations, which are located on the perimeter of our City limits. We believe that the impact to the citizens and the environment of the City of Falls Church has neither been assessed nor mitigation measures considered or developed. Specifically, the City has the following concerns:

- The draft EIS has failed to meet the legal requirements of an Environmental Impact Statement regarding significant impact analysis in particular areas as required by 40 CFR 1502.14 and 40 CFR 1508.9, including the City of Falls Church, which will be impacted by this proposed Project.

- The draft EIS has failed to fully assess water, traffic, and transportation impacts on the City of Falls Church and thus propose mitigation of those potential impacts.

- The draft EIS has failed to adequately address issues of parking overflow in the residential areas adjacent to the East and West Falls Church Metro Stations.

- The draft EIS has failed to adequately address public safety and infrastructure issues regarding pedestrian traffic (especially students) conflicting with vehicular

traffic in and around the West Falls Church Metro Station, given the prediction for increased vehicle trips per day.

- The draft EIS has failed to address the environmental impact to surface and ground water as it might affect the City, the City's water distribution system that serves much of the Corridor, and Four Mile Run.

The City of Falls Church understands the legal requirements and the framework of the Environmental Impact Statement, which is to insure that all issues, alternatives and concerns are weighed and evaluated for remedy. In attempting to meet these specific requirements, we believe that mitigation of the Project impact on the City of Falls Church and its immediate surroundings has not been sufficiently addressed. Moreover, given our past history of corresponding on these and similar issues, we continue to believe the City's concerns have not been given full evaluation.

EIS regulations state that the comparative analysis, including the proposed action, is the heart of an EIS (40 CFR 1502.14) and require a rigorous exploration and objective evaluation of reasonable alternatives, including a possible no action alternative. Reasonable alternatives include those that are practical or feasible from a common sense, technical and economic standpoint. Federal regulations (40 CFR 1508.9) recommend that the EIS address environmental impacts in proportion to their potential significance. Impact analysis is intended to concentrate on project attributes that have a significant impact or potential for significant impacts. We contend that this EIS overlooked significant impacts as they relate to the City of Falls Church and its environs.

It is our understanding that the Dulles Corridor Project is a phased regional rapid transit project with planned station facility improvements within the East and West Falls Church Metro Station areas. Given this understanding, we firmly believe this project will have a substantial vehicular traffic impact on the City as the East and West Falls Church Metro Stations transform into a major regional transportation/transit hub in the future. From the outset, the City has been concerned that the Project will bring thousands of additional motorists into the City, and urged that plans must be made to accommodate the additional traffic. In addition, new parking facilities may be needed at either metro station to support the ridership. If these motorists drive to the stations and cannot find parking, they will try to park on the residential streets, creating a significant impact on the surrounding neighborhoods. The City has repeatedly requested that these impacts, and others, be anticipated and addressed.

Our review of the draft EIS indicates that these key concerns have not yet been addressed for the City of Falls Church. The Project, while appearing to be beneficial to the region, has a significant and direct negative impact on the City in a manner not fully analyzed in

the draft EIS. Additionally, we believe the Project has large-scale and complex impacts on the City. We have previously asked that these impacts be thoroughly studied (Attachments 1–4), however, we have now concluded that they have not been given full consideration.

Following our review of the Draft EIS, we are particularly troubled that the impacts to the East Falls Church Metro apparently have never been considered. For this reason, we find the EIS significantly flawed and formally request that this area be examined and fully evaluated.

While a limited analysis was performed for the West Falls Church Metro station, we discovered that project impacts were not considered in many of the Technical Reports including Land Use and Socioeconomic, Air Quality and Economics, and Secondary Development Effects. Although West Falls Church Metro is included in the Noise Technical Report, we are concerned that the full impact has not been analyzed. We believe very strongly that the EIS must be revised to consider impacts in all Technical Reports for both the East and West Falls Church Metro areas. This project impacts our residents' quality of life in a myriad of ways and these impacts must be considered in order to be fully compliant with Federal EIS regulations.

The draft EIS did address one critical area of concern to the City -- Traffic Analysis and Station Access for the West Falls Church Metro area. While it generally addresses some concerns, we believe it falls short in its analysis. Please let me reiterate the City's critical concerns as related to this Technical Report:

- **Traffic** – The traffic generated by this project will greatly diminish the quality of life of our residents. We asked that the City's traffic consultant review and analyze the EIS. His comments are attached (Attachment 5). It is of great concern that nineteen (19) separate technical issues were identified as needing to be rectified or clarified. Our consultant states that these "shortcomings, inconsistencies, and concerns/questions are found to be rather troublesome." In addition to these specific technical issues, it is our view that the traffic impacts were not fully analyzed in four key areas:

    - **Assumptions** – We believe the assumption that ridership will not increase and the assumption that failing intersections should not be improved is fundamentally flawed. Every projection throughout the EIS shows thousands of anticipated new riders. One of the project's major goals is to increase ridership and, certainly, at the starting point for the service, additional persons will be traveling to this destination.

- **Impacts** – The traffic impacts are more far reaching than the intersections studied. The City had requested that thirteen (13) key intersections be studied and is disappointed to find only three (3) were considered. The City continues to believe this project may have a significant impact on Falls Church and its environs requiring analyses that would include secondary and cumulative effects of traffic increases through existing neighborhoods. This potential for increased commuter "cut through" traffic needs to be monitored and will require the collection of additional traffic counts.

- **Equity** – The City is more directly impacted than other communities, but these impacts were not analyzed at the same level of detail as the proposed Metro stations. Unlike the planned stations in Tyson's Corner, the impact of traffic overflow will be felt on adjacent residential streets causing safety concerns for our residents. It is puzzling to then contrast that only the three (3) directly adjacent intersections at the West Falls Church Metro area were analyzed, whereas, for the new stations, as many as nine (9) and an average of five (5) adjacent intersections were analyzed.

- **Mitigation measures** – Table 6.2-6, "Summary of Traffic Issues and Proposed Mitigation Measures," does not address or consider Falls Church traffic issues or propose mitigation measures.

- **Parking** – The pressure for Metro parking on the City's residential streets is extreme at present. We are finding that permit parking or time restrictions simply moves the parking further out into other City neighborhoods impacting more and more residents constantly.

  - **Assumptions** – The assumption that parking needs will not increase is flawed. The recently announced potential addition of 1,000 parking spaces at the West Falls Church Metro area clearly indicated parking needs are greater than stated in the report.

  - **Impacts** – Parking studies are needed for both the East and West Falls Church Metro areas.

  - **Equity** – The City and its environs have more residential streets impacted than any other locality, but no consideration was given to how parking will be handled on those streets.

- **Public Safety/Infrastructure** – The City is unique in that the West Falls Church Metro area is directly adjacent to City owned property, which includes the George Mason Middle and High Schools, as well as the UVA/Virginia Tech Grad Center.

  - **Assumptions** – The assumption that failing roadways should accommodate more traffic without improvements is flawed. One of the major goals of the Project is to support future development. However, in reality, the Project may actually prohibit such future development in the area and severely limit the City's future economic development potential because existing roads are now operating at near or full traffic capacity.

  - **Impacts** - It is troubling that little consideration was given to pedestrian improvements as a significant number of young people traverse this area due to the proximity of schools. We see pedestrian and vehicular conflicts increasing as enrollments and car trips increase in this small geographic area. There are no plans for widening either US 29 or VA Route 7 within the City and the City's Adopted Comprehensive Plan and Streetscape Plan do not recommend any future street widening in the City. As a result, the existing streets will have to accommodate any increased vehicular traffic.

  - **Equity** – Public safety and infrastructure improvements are included in the EIS recommendations for many other impacted areas, but not for the City of Falls Church.

  - **Water** – The Draft EIS addresses possible impacts to surface and ground water. Section 4.1.5.2 acknowledges the possibility of ground water degradation from contaminates, but the ground water study does not address Falls Church ground water. Furthermore, the inventory of surface water sources that might be negatively impacted within the watershed of the affected Project area omits the Four Mile Run and its tributaries. This is a significant omission that must be addressed. Additionally, Section 4.1.3.2 addresses consideration of Fairfax and Loudoun County public water and waste water systems, but omits consideration of possible impact to the Falls Church water system, which not only serves Falls Church City but also a substantial portion of the Project area. This omission is very significant and must be addressed by analyzing possible impacts and proposing mitigation measures.

  - **Social effects** – The Draft EIS at Section 3.0 addresses social effects of the proposed Project. It attempts to analyze and identify potential effects on each of the affected communities and their services and facilities. The

document, at Section 3.2, states that the section includes consideration of schools. However, the potential impact upon the Falls Church City Public School system, due to the close proximity of the Project and the attendant traffic and safety concerns, is completely omitted. This is another significant oversight that must be addressed.

Overall, we strongly believe the Draft EIS' lack of full analysis could prove disastrous for the City, the surrounding neighborhoods and our educational structures. Moreover, we suspect there may be a tremendous safety concern if proper evaluations are not conducted. We believe our neighborhood streets will be inundated with motor vehicles and the project will be considered a failure. Existing infrastructures will be adversely affected and must be effectively remedied by operational plans and new facilities.

Finally, it is our position that there is still much work to do in order for the Draft EIS to address the long-range concerns that have been previously raised by the City, including the safety concerns that continue to be paramount in the minds of our citizens, and which have not yet been studied, let alone, resolved. While we may be critical of the EIS, we remain firmly committed to public transportation and recognize and accept that it is critical to the elimination of air pollution, minimization of vehicular transportation on city streets and in our neighborhoods. Towards this end, Section 10.3 of the Draft EIS, entitled "Issues to be Resolved," should be amended to include the Falls Church City issues raised herein.

The City Council and I would appreciate your careful review and attention to these Falls Church issues. We further request that you initiate timely and appropriate analyses regarding those issues that will most directly impact the City of Falls Church and its environs. The City Council extends its appreciation to the FTA, DRPT and WMATA for its leadership in this critical transportation and transit planning for Northern Virginia. Please contact Council Member David Snyder, who serves on the Northern Virginia Transportation Commission (NVTC), Transportation Coordinating Council of Northern Virginia (TCC) and National Capital Regional Transportation Planning Board (TPB), at 202-828-7161 or Daniel McKeever, City Manager, at 703-248-5004 with any questions and responses.

Sincerely,

Daniel E. Gardner, Mayor

Ref: Scope of Work for *VDRPT Comprehensive Transportation/Traffic* Management Plan Assistance – Dulles Corridor Rapid Transit Project

Dear Mr. Rohrer:

Thank you for meeting with the City's team on November 1, 2000 to discuss the impact of the *Dulles Corridor Rapid* Transit *Project*. In accordance with our discussion relating to the scope of the *Dulles Corridor Rapid* Transit *Project* study and the effort to mitigate the impact of the *project*, the City requests your assistance in developing a comprehensive traffic *management* plan for the City of Falls Church and vicinity. This is based on the need to evaluate potential transportation issues as Falls Church emerges as a regional transportation hub in the future. *Of* the numerous future planned roadway and transit improvements *that will converge* in the Falls Church area the Dulles Corridor Rapid Transit Project will *be one of the first with a terminus involving both the* West Falls Church *and East Falls Church* Metro Stations and vicinity. *While mobility of travelers in the Dulles Corridor and around the region will be significantly improved these new station terminus points in the vicinity of Falls Church will* impact *the city* dramatically in the future. A comprehensive transportation study and plan is needed to effectively coordinate and address *future* regional mass transit linkages, *inter-modal facilities, impact of increased* local *vehicle* traffic/*congestion, parking needs/deficiencies*, safety and land use issues.

The following is some background information that details the City's *need and* efforts to date to secure transportation planning *assistance*.

Basis for Comprehensive Traffic Management Study/Plan:

Several recent *local mixed-use development* projects have suggested the need to do a comprehensive study and to create a plan for traffic management and calming in the City *in order to address potential adverse traffic impacts of larger scale developments. However, of even more significance are* the various *current regional transit plans and projects* including the Dulles Corridor Project, a *phased* regional *rapid* transit project *with planned station facilities within the East and West Falls Church Metro Station areas, that will have an even more substantial vehicular traffic impact on the City as it transforms into a major regional transportation/transit hub in the future.*

The *initial* phases of the planned regional *Dulles Corridor* mass transit project *will include the provision of express* bus rapid transit (BRT) from the West Falls Church Metro Station to Dulles Airport. The *subsequent* phases of this project will provide a rail link from the East Falls Church Metro Station to Dulles and possibly a rail link from one of the metro stations to Springfield. These changes could potentially bring thousands of additional motorists into the City, and thus some plans must be made to accommodate the additional traffic. In addition, *new* parking facilities *may be needed* at either metro station to support the ridership. If these motorists drive to the stations and cannot find parking, they may try to park on the residential streets, creating a significant impact on the surrounding neighborhoods. This issue must also be anticipated and addressed.

The combination of the *planned* BRT/Metro *transit* link*ages* suggests that *initial portions of a* comprehensive *traffic management* study and plan should be completed using funds earmarked for the Dulles Corridor Transit Project to whatever extent is possible. *The initial phases of the* study should be comprised of the following; 1) a thorough analysis of existing conditions on residential and commercial streets, which could require a large data collection and analysis effort to include traffic volumes, speed, street designs, traffic light signalization, and an analysis of pedestrian, bicycle, and mass transit facilities. 2) to *develop projections regarding* the potential increases in traffic generation due to the BRT/Metro link, proposed redevelopment projects, and other developments, and the impacts of those increases on both commercial and residential streets, as well as on pedestrians, cyclists and mass transit riders; and 3) a plan, which would include recommendations for mitigating current and future potential traffic impacts on the City's transportation system and residents through a variety of means. *The City could then use results of this initial study and plan along with its baseline data to complete the final phases of a comprehensive traffic management plan. The recently adopted 2020 Northern Virginia Transportation Plan, the currently ongoing Dulles Corridor Rapid Transit Project NEPA and PE studies and other general regional traffic data collection and modeling by the Virginia Department of transportation (VDOT) should provide much of the data needed to address the Falls Church study area.*

The following is a statement of goals and objectives for the Study/Plan and specific expectations for deliverables.

Goals and Objectives of Study/Plan

GOAL: To maintain the quality of life within the City as the new BRT and rail links to the City's Metro stations and as new development occurs in and around the City.

- To ensure safety on residential streets, controlling parking and the speed and volume of traffic on them.

- To ensure efficient traffic movement into and within the City on primary streets with minimum impacts on existing Level of Service (LOS).

- To provide as many non-vehicular (pedestrian, bicycle, and mass transit) safe, convenient, and integrated transportation options as possible to move people into and within the City and to mass transit facilities.

- To create a small model of multimodal/intermodal efficiency that might be replicated in other areas of the Country.

Expected Deliverables for Project

- A comprehensive inventory and assessment of existing transportation facilities, parking facilities, and traffic conditions in the City -- vehicular and non-vehicular (pedestrian, bicycle, and mass transit). This should also note deficiencies.

- A review of the existing transportation systems in Arlington and Fairfax Counties and previously developed regional transportation plans.

- A forecast of traffic, travel, and parking demand as a result of (a) the BRT, (2) future rail links to metro, (3) future anticipated development within and near the City, (4) the above scenarios if HOV does not exist on I-66, and (5) the above scenarios if HOV begins at Route 29 instead of the Beltway

Please review the City's proposal and contact me to set up a meeting to confirm the scope of the study and associated timelines.

Sincerely,

Daniel E. McKeever
City Manager

Mr. Len Alfredson, P.E. Project Manager
Dulles Corridor Transit Project
1550 Wilson Boulevard
Suite 300
Arlington, Virginia 22209

Dear Mr.Alfredson:

The City of Falls Church appreciates the opportunity to review and comment on the Dulles Corridor Rapid Transit Project and its scope of work for the environmental impact study under the PE/NEPA process. The City Council and I support the continued evaluation and refinement of alternatives to provide proposed transit improvements in the Dulles Corridor, Tyson's Corner and Falls Church areas, which would serve as the easternmost terminus of the new proposed transit corridor. We also appreciate your taking time from your busy schedule to brief us on the project at the Council Work Session on July 31st.

We believe this project will have a significant impact on the City requiring environmental analyses that would include -- secondary and cumulative effects; transportation and traffic; land use, zoning and economic development; land acquisition, displacements and relocation of existing uses; neighborhoods and communities. Other key PE/NEPA objectives include financial analyses of funding sources for project capital, operating and maintenance costs and engineering analyses of possible alternative alignments.

On behalf of the City Council I request that the Federal Transit Administration (FTA), Virginia Department of Rail and Public Transportation (DRPT) and the Washington Metropolitan Area Transit Authority (WMATA) carefully review and consider our comments and initiate appropriate action and analyses to address these issues. Allow me first to provide some important contextual background.

Background:

- The City is not planning any future widening of US 29 or VA Route 7 (within the City) and will work to maintain the character of these roadways. US 29 currently carries 31,000 vehicles per day and VA Route 7 35,000 vehicles per day through the City.

- The City's Adopted Comprehensive Plan and Streetscape Plan does not recommend any future street widening in the City, and as a result the existing streets will have to accommodate any increased vehicular traffic.

- The City and School Board are major landowners in the vicinity of the West Falls Church Metrorail Station, as they own the Virginia Tech/University of Virginia Graduate Center (City leased land to universities) and George Mason Middle/High School properties. The City is also encouraging the redevelopment of a large area of land (Gordon Road Triangle area) within two blocks of the West Falls Church Metrorail Station.

City and Regional Roadway Impacts:

- Establishing BRT at the West Falls Church Station and full rail service at the East Falls Church Station intensifies the need for a transportation/traffic management and impact study for the City to evaluate potential impacts and develop appropriate mitigation measures. This point is made more clear by the projection of 48 buses during the peak hour can be accommodated at the West Falls Church station during the BRT phase of the project. A traffic impact study for the West Falls Church area needs to be an integral part of the analysis for this project.

- Establishing BRT at the West Falls Church station, and full rail at the East Falls Church station without taking into consideration the traffic impacts along the Route 7 corridor from Falls Church to Tyson's Corner is shortsighted. The project must consider the impact of the BRT through this corridor as well as any projected changes in traffic volume that may occur as a result of project providing access to Dulles from the Falls Church and Tyson's Corner areas. In addition, the study must consider relieving US 50 of its prohibition against truck traffic as a way to relieve VA Route 7 of this traffic traveling through the City of Falls Church.

- What alternatives are available to mitigate traffic bottlenecking in the City due to increased vehicle trips on vicinity roads of traffic through the City to and from the East Falls Church and West Falls Church stations as transit rider ship increases? Without this information WMATA is doing a disservice to this process and in particular, to those commuters who use Route 7 from Baileys Crossroads to Tyson's Corner. It is not logical to conclude the majority of riders to Dulles will be riders who are already on the system.

- What measures will be taken to protect City residential neighborhoods from increased commuter traffic? WMATA should consider alternatives that rely on off site parking facilities and shuttles to the East and West Falls Church station that would relieve city streets from a large part of this traffic leaving it to shuttles. The City would like to play a part, if not a partner, in this analysis and ultimately discussions of potential solutions and sites.

Transit Improvements:

- WMATA should consider utilizing the both the West Falls Church and East Falls Church stations for the BRT. By utilizing the East Falls Church station the project invests its time, analysis and money in the station that will ultimately support the full rail service thereby dissipating some of the traffic and transportation impacts along Route 7 and on local roadways around the West Falls Church station. This would obviously entail close coordination with Arlington County.

- Analyze all currently proposed and alternative mass transit improvement options (i.e. impact, benefits, physical constraints), including light rail alternatives as proposed in the 1999 Northern Virginia 2020 Transportation Plan. The project should also consider linkages between certain nodes along this light rail, from Baileys Crossroads through Falls Church, to the Station that will best provide efficient access and service to Dulles. These linkages might be light rail, bus, or electric bus.

- Additional studies are needed to evaluate alternatives for increased parking at or near the West and East Falls Church Metrorail Stations. WMATA representatives have advised the City that a study is planned for the West Falls Church Metrorail Station, but a study is also needed for the East Falls Church Metrorail Station.

Financing Strategies:

- Explore public/private partnerships for alternative funding of transit improvements as opposed to seeking local subsidies.

- Take steps to insure that project costs that project limited benefits to one jurisdiction only, do not become financial obligations of another jurisdiction.

- Carefully consider the impacts from Special Taxing Districts. There will be strong opposition to any tax proposal especially if the DCRT project does not provide the City with additional economic development opportunities.

Land Use:

- Consider carefully improvements that may have cumulative and secondary impacts related to changes in future land regulations and requirements. There are clear differences in land use opportunities associated with the project. Falls Church City, which is fully built out, will be impacted very differently than areas in Fairfax and Loudon Counties. Fairfax and Loudon have the opportunity to plan their land use and its impacts, while we here in Falls Church must deal with the impacts of the project as it relates to the current use of the land.

Other Issues:

- WMATA needs to consider, if not fully study and analyze, the impact on the City (traffic, noise, parking, etc.) from extended operating hours of Dulles Airport. The early and extended hours of operation of Dulles Airport may conflict with normal commuting patterns or, more importantly, extend the length of time the City's transportation network is impacted by the increased traffic volume.

- The City of Falls Church and Fairfax County will be working together to review, evaluate and address future land use issues, impacts and opportunities in the West Falls Church Metrorail Station vicinity.

- The City will also be working closely with Arlington County on those issues related to the East Falls Church stations and nearby commercial and residential sections of the City.

- It is critically important the City of Falls Church be specifically included in the EIS portion of the project and, more importantly, be fully included in any and all traffic and transportation studies and/or analysis conducted for this project.

The City Council and I would appreciate your careful review and attention to these issues and to initiate timely appropriate analyses regarding those issues that will most certainly affect the Falls Church and its environs. The City Council extends its appreciation to the FTA, DRPT and WMATA for their leadership in this critical transportation and transit planning for Northern Virginia. Please contact David Snyder, Council member, who is on regional transportation boards that include the Northern Virginia Transportation Commission (NVTC), Transportation Coordinating Council of Northern Virginia (TCC) and National Capital Regional Transportation Planning Board (TPB), at 202-828-7161 or Daniel McKeever, City Manager at 703-248-5004 with any questions and responses.

Sincerely,

Daniel E. Gardner, Mayor

Mr. Len Alfredson, P.E. Project Manager
Dulles Corridor Transit Project
1550 Wilson Boulevard
Suite 300
Arlington, Virginia 22209

Dear Mr.Alfredson:

The City of Falls Church appreciates the opportunity to review and comment on the Dulles Corridor Rapid Transit Project and its scope of work for the environmental impact study under the PE/NEPA process. The City Council and I support the continued evaluation and refinement of alternatives to provide proposed transit improvements in the Dulles Corridor, Tysons Corner and Falls Church areas, which would serve as the easternmost terminus of the new proposed transit corridor.

e believe this project will have a significant impact on the City requiring environmental analyses that would include -- secondary .d cumulative effects; transportation and traffic; land use, zoning and economic development; land acquisition, displacements and relocation of existing uses; neighborhoods and communities. Other key PE/NEPA objectives include financial analyses of funding sources for project capital, operating and maintenance costs and engineering analyses of possible alternative alignments.

On behalf of the City Council I request that the Federal Transit Administration (FTA), Virginia Department of Rail and Public Transportation (DRPT) and the Washington Metropolitan Area Transit Authority (WMATA) carefully review and consider our comments and initiate appropriate action and analyses to address these issues. Allow me first to provide some important contextual background.

Background:

- The City is not planning any future widening of either US 29 or VA Route 7 and will work to maintain the character of these roadways.

- The City's Adopted Comprehensive Plan and Streetscape Plan does not recommend any future street widening in the City, and as a result the existing streets will have to accommodate any increased vehicular traffic.

- The City and School Board are major landowners in the vicinity of the West Falls Church Metrorail Station, as they own the Virginia Tech/University of Virginia Graduate Center (City leased land to universities) and George Mason Middle/High School properties. The City is also encouraging the redevelopment of a large area of land (Gordon Road Triangle area) within two blocks of the West Falls Church Metrorail Station.

City Roadway Impacts:

- Establishing BRT at the West Falls Church Station and full rail service at the East Falls Church Station intensifies the need for a transportation/traffic management and impact study for the City to evaluate potential impacts and develop appropriate mitigation measures. This study is needed to effectively coordinate and address mass transit linkages and local traffic, parking, safety and land use issues.

- What alternatives are available to mitigate traffic bottlenecking in the City due to increased vehicle trips on vicinity roads of traffic through the City to and from the East Falls Church and West Falls Church metrorail stations as transit ridership increases? WMATA needs to be prepared to study increased day trips to both of these stations. It is not logical to conclude the majority of riders to Dulles will be riders who are already on the system.

- What measures will be taken to protect City residential neighborhoods from increased commuter traffic?

Transit Improvements:

- Analyze all currently proposed and alternative mass transit improvement options (i.e. impact, benefits, physical constraints), including light rail alternatives as proposed in the 1999 Northern Virginia 2020 Transportation Plan.

- Additional studies are needed to evaluate alternatives for increased parking at or near the West and East Falls Church Metrorail Stations. WMATA representatives have advised the City that a study is planned for the West Falls Church Metrorail Station, but a study is also needed for the East Falls Church Metrorail Station.

Financing Strategies:

- Explore public/private partnerships for alternative funding of transit improvements as opposed to seeking local subsidies.

- Take steps to insure that project costs that are incidental only to a particular jurisdiction, do not become the obligation of any other jurisdiction.

- Carefully consider the impacts from Special Taxing Districts. There will be strong opposition to any tax proposal especially if the DCRT project does not provide the City with additional economic development opportunities.

Land Use:

- Consider carefully improvements that may have cumulative and secondary impacts related to changes in future land regulations and requirements.

Other Issues:

- WMATA needs to consider, if not fully study and analyze, the impact on the City (traffic, noise, parking, etc.) from extended operating hours of Dulles Airport. The early and extended hours of operation of Dulles Airport may conflict with normal commuting patterns or, more importantly, extend the length of time the City's transportation network is impacted by the increased traffic volume.

- The City of Falls Church and Fairfax County will be working together to review, evaluate and address future land use issues, impacts and opportunities in the West Falls Church Metrorail Station vicinity.

The City Council and I would appreciate your careful review and attention to these issues and to initiate appropriate analyses as they may affect the City and its environs. The City Council extends its appreciation to the FTA, DRPT and WMATA for their leadership in this critical transportation and transit planning for Northern Virginia. Please contact David Snyder, Council member, who is on regional transportation boards that include the Northern Virginia Transportation Commission (NVTC), Transportation Coordinating Council of Northern Virginia (TCC) and National Capital Regional Transportation Planning Board (TPB), at 202-828-7161 or Daniel McKeever, City Manager at 703-248-5004 with any questions and responses.

Very truly yours,

Daniel E. Gardner, Mayor

December 17, 1999

Mr. Leo J. Bevon, Director
Virginia Department of Rail and Public Transportation
1401 East Broad Street
Richmond, Virginia 23219

Dear Mr. Bevon:

I wanted to take a moment to update you on the City's efforts to seek transportation planning assistance in developing a comprehensive traffic management study plan for the City of Falls Church and vicinity. This is based on the need to evaluate potential transportation issues as Falls Church emerges as a regional transportation hub in the future. The numerous future planned roadway and transit improvements including the Dulles Corridor Rapid transit project that will converge at the West Falls Church Metro Station and vicinity will impact Falls Church dramatically in the future. A comprehensive transportation study and plan is needed to effectively coordinate and address regional mass transit linkages and local traffic, parking, safety and land use issues.

The announcement at the December 7, 1999 meeting of the Dulles Corridor Task Force to fund a transportation planner for Fairfax County was of particular interest to the City and myself. As you may be aware the previous City Manager, Hector Rivera had been pursuing for almost a year through the Commonwealth of Virginia Secretary of Transportation and Virginia Department of Transportation (VDOT) funding for a similar transportation planner/engineer position. This grant based City staff position or VDOT assistance would involve work on a variety of transportation management, traffic and land use issues. Currently the City does not have either a transportation planner or transportation engineer on staff.

I have included some background information for your review that details the City's efforts to date to secure transportation planning assistance. I will call you so we can plan to have lunch soon to discuss the City's interests and what assistance may be available now and in the future. I also can be reached at (202) 828-7161 (work).

Very truly yours,

David Snyder /gsh

RE: Dulles Corridor Transit Project – Draft EIS

SUBJ: Impact Evaluation
City of Falls Church, Virginia

Dear Mr. Beidas:

I am pleased to provide the following *"Impact Evaluation"* for the referenced draft EIS report dated January 28, 2002 (including revised Section 8.0 dated March 15, 2002). This brief evaluation reviews this EIS report in consideration of possible impacts to the City of Falls Church, particularly the affected Metrorail stations and environs with the City of Falls Church. Based on my evaluation of this report (and revised Section 8.0 attachment), I offer the following observations and comments (presented in order by Section of the EIS report):

Section
Section 1.0 -- No comment.
Section 2.2 -- It is noted that the BRT alternative includes modification to the West Falls Church Metro Station.
Section 3 – No comment.
Section 4 – No comment.
Figure 5-1 – At the Haycock Rd./Falls Reach Drive intersection, it is shown that the predominant AM inbound flow is from Great Falls Street, yet the predominant PM outbound flow is to the other direction (towards Rt.7). This is a curious traffic pattern where the predominant outbound trips (from West Falls Church Metro Station) are opposite of the predominant inbound trips. This should be explained further.
Figure 5-17 – At the Haycock Rd./Falls Reach Drive intersection, there are "movements" going into an unmarked road opposite Falls Reach Drive. Perhaps this unmarked road is one-way, yet nothing is shown on this graphic. This should be explained further.
Section 5.3.2 – Roadway analysis was performed for eight (8) roadway segments, not including Rt.7 near Falls Church (e.g., near Haycock Road). Why not? It seems this important eastern end of the study area should have been included.
Section 6.1 – Level Of Service (LOS) analyses were conducted for selected highway links, but not Rt.7. Why not? Again, it seems this important highway corridor within the study area should have been included.
Section 7.1 – A general statement is made that *"... traffic impacts within the Orange Line Connection subarea of the corridor are not expected to be significant."* On what basis is this general statement made? On what proof or evidence can this be made?

Section 7.1 – It is stated that *"...no formal analysis of park/kiss-and-ride entries and exits or the nearby local road network was undertaken for the East Falls Church metro station area..."* due to insignificant increase in traffic near the station, yet it is also stated that *"... implementation of either the Metrorail or BRT/Metrorail Alternative would result in increased off-peak service frequencies at East Falls Church for eastbound trains..."* These statements seem contradictory. An explanation of how increased off-peak service creates no significant increase in traffic near the affected station needs to be clarified.

Section 8.2 (March 15, 2002) – It is stated that none of the planned changes to the West Falls Church Metro station are assumed in the analysis, yet no explanation is provided as to why? Also, isn't a parking garage being planned/programmed for this station? If so, why isn't this included in the analysis?

Table 8-1 (March 15, 2002) – This table shows exactly the same LOS and delay for the Rt.7/Haycock Rd. and Haycock Rd./West Falls Church Station Parking Entrance intersections during the AM and PM peak hours for the 2025 Baseline condition. It is highly unlikely that this coincidence would occur. This needs to be checked and verified.

Section 8.3.1 (March 15, 2002) – Under the "BRT Alternative" it is stated twice that the Rt.7/Haycock Rd. intersection would improve to LOS C in the PM peak hour. I believe that this applies to the AM peak hour as well (per Table 8-1).

Section 8.3.1 (March 15, 2002) – Under the "BRT Alternative" it is stated that *"...any of the build alternatives would reduce the demand for parking at the West Falls Church Station ..."*, yet no evidence is presented to support this finding.

Section 8.3.2 (March 15, 2002) – It is stated here that *"...only selected intersections and station entrances/exits are analyzed."* It is curious why the most impacted intersection in the West Falls Church Metro Station area (Great Falls Rd./Haycock Rd. intersection) was not part of the analysis.

Section 8.3.2 (March 15, 2002) – It is stated here that *"...because it is the controlling time period for the design year, only the PM peak hour conditions have been analyzed..."* Since the area near the West Falls Church Metro Station (i.e., Rt.7/Haycock Rd. intersection area) is directly influenced by the adjacent educational facilities, thus directly and strongly influenced during the AM peak hour much more than the PM peak hour, it is questionable why only the PM peak hour was analyzed, and not the AM peak hour.

Section 8.5 (March 15, 2002) – It is stated that since *"... the project is not anticipated to have a negative impact on adjacent intersections, analysis of pedestrian and bicycle access and circulation was not undertaken."* In light of prior comments and uncertainties, it is not necessarily factual that no negative impact has been afforded at adjacent intersections, thus perhaps pedestrian and bicycle access and circulation should be conducted.

Section 8.6 (March 15, 2002) – It is claimed that the measured "delay" impact is not significant enough to warrant mitigation. Under what criteria is this based? This seems to be objective.

Figure 8-1 (March 15, 2002) – The predominate PM peak hour traffic flow out of Falls Reach Drive is contrary to that shown in Figure 5-1. Which is correct?

Section 22.0 – It is noted that the study only accesses the potential effects of development near the Tysons Corner and Mid-Corridor areas. Apparently no development is forecast near the Falls Church Metro Stations. This needs to be verified with the City.

Section 22.2 – It is noted that *"... the increase in traffic attributable to the rail development-related forecasts represent area-wide impacts."* It is curious whether these area-wide impacts reach to Falls Church Metro Station areas.

Section 22.2 – The final paragraph of the report states that development will result in increased ridership and also attract additional traffic to adjacent roadways. Does this apply to roadways near the Falls Church Metro Stations? This needs to be clarified.

All in all, I find the report rather comprehensive and well done – mostly within standard methodologies and criteria. However, I do note and find some of the above-identified shortcomings, inconsistencies, and concerns/questions to be rather troublesome, which should be rectified and/or clarified.

I trust that this evaluation provides you with the information requested. Please feel free to call me if you should have any questions.

Respectfully Submitted,
VETTRA Company

MEMORANDUM

DATE: June 25, 1999

TO: Hector A. Rivera, City Manager

FROM: Helen Reinecke-Wilt. Senior Planner HR-W
Wayne French. Director, Public Works Division WF
Samer Beidas. City Engineer
Harry Reitze, Captain. Falls Church City Police
Jim Gahres. Economic Development Authority Deputy Director
Halsey Green. Director. Finance Division
Otis Smith. Assistant to the City Manager

SUBJECT: Scope of Work for VDOT Transportation Management Plan Assistance

Basis for Comprehensive Traffic Management Study/Plan:

Several projects have suggested the need to do a comprehensive study and to create a plan for traffic management and calming in the City. These include recent plans for a two stage regional mass transit project, which will impact the East and West Falls Church Metro Stations; the City's Comprehensive Plan; and TR99-11, an add-on to the adopted Mixed-Use Redevelopment (MUR) Ordinance.

The first phase of the planned regional mass transit project will provide bus rapid transit (BRT) from the West Falls Church Metro Station to Dulles Airport. The second phase of this project will provide a rail link from the East Falls Church Metro Station to Dulles and possibly a rail link from one of the metro stations to Springfield. These changes could potentially bring thousands of additional motorists into the City, and thus some plans must be made to accommodate the additional traffic. In addition, no new parking facilities are proposed at either metro station to support the ridership. If these motorists drive to the stations and cannot find parking, they may try to park on the residential streets, creating a significant impact on the surrounding neighborhoods. This issue must also be anticipated and addressed.

A second purpose for this study/plan lies within the City's Comprehensive Plan, adopted in November 1997. This plan recommends that the City create a comprehensive traffic-calming

plan due to the constant complaints by residents about vehicular speeding and traffic volume on residential streets during the past 10 years or so. After several years of being asked to consider piecemeal traffic problems, the City's Transportation Committee realized that a comprehensive plan to address these issues was necessary to insure safety and efficient traffic flow for vehicular and non-vehicular traffic throughout the City. The new BRT and rail link proposal will compound the City's existing traffic problems.

TR99-11, a resolution in support of sustainable development in the Mixed-Use Redevelopment (MUR) areas, was adopted by the City Council along with the MUR Ordinance on March 8, 1999 (See attachment). This resolution stated that a variety of actions should take place as soon as possible. One of these actions is transportation and parking study to determine the potential impacts of fully developed MUR areas on both the residential neighborhoods and commercial districts. It also called for recommendations on how the additional traffic could be accommodated.

The combination of the BRT/Metro link, the Comprehensive Plan, and the associated MUR resolution, suggests that a comprehensive study and plan should be completed using the VDOT grant-based staffing to whatever extent is possible. This study should be comprised of a thorough analysis of existing conditions on residential and commercial streets, which could require a large data collection and analysis effort to include traffic volumes, speed, street designs, traffic light signalization, and an analysis of pedestrian, bicycle, and mass transit facilities. The second phase of the study should be to project the potential increases in traffic generation due to the BRT/Metro link, MUR projects, and other developments, and the impacts of those increases on both commercial and residential streets, as well as on pedestrians, cyclists and mass transit riders. The third and final phase should be a plan, which would include recommendations for mitigating current and future potential traffic impacts on the City's transportation system and residents through a variety of means. This should include recommendations for a variety of traffic calming measures on residential street; recommendations for improvements to pedestrian and bicycle facilities; as well as recommendations for the efficient utilization of other alternative modes of transportation. Transportation demand management techniques for new businesses such as carpooling, shuttles to metro, and employee mass transit cost-sharing should also be considered amongst the recommendations. This plan must be comprehensive in terms of both the physical or built environment and human element. The safety of vehicles and pedestrians and a peaceful environment for residents must be maintained.

The following is a statement of goals and objectives for the Study/Plan and specific expectations for deliverables.

Goals and Objectives of Study/Plan

GOAL: To maintain the quality of life within the City as the new BRT and rail links to the City's Metro stations and as new development occurs in and around the City.

- To ensure safety on residential streets, controlling parking and the speed and volume of traffic on them.

- To ensure efficient traffic movement into and within the City on primary streets with minimum impacts on existing Level of Service (LOS).

- To provide as many non-vehicular (pedestrian, bicycle, and mass transit) safe, convenient, and integrated transportation options as possible to move people into and within the City and to mass transit facilities.

- To create a small model of multimodal/intermodal efficiency that might be replicated in other areas of the Country.

Expected Deliverables for Project

- A comprehensive inventory and assessment of existing transportation facilities, parking facilities, and traffic conditions in the City -- vehicular and non-vehicular (pedestrian, bicycle, and mass transit). This should also note deficiencies.

- A review of the existing transportation systems in Arlington and Fairfax Counties and previously developed regional transportation plans.

- A forecast of traffic, travel, and parking demand as a result of (a) the BRT, (2) future rail links to metro, (3) future anticipated development within and near the City, (4) the above scenarios if HOV does not exist on I-66, and (5) the above scenarios if HOV begins at Route 29 instead of the Beltway.

- An identification of future transportation needs and deficiencies.

- An assessment of the projected impacts on special needs populations, in particular the elderly and physically disabled.

- A comprehensive and workable Transportation Management Plan that includes alternatives for state of the art traffic-calming techniques as well as for each mode of transportation and commensurate parking resources. This Plan must meet the goal and objectives as stated.

- A model that demonstrates this plan.

- An implementation plan.

- Public Information -made available for the City's Web Page.

Project Management Specifics

- A public participation process for the project would be developed by the City. This would include a minimum of at least one Planning Commission and one City Council public hearing and several neighborhood meetings to explain the initial findings of the study and receive input for the plan component.

- The City would have the ability to review and comment on draft recommendations prior to the publication of the final document.

- The City anticipates that this Study/Plan should be completed within six to nine months of the execution of the contract.

- A review of the actual impacts of the BRT should be made within six to nine months of the program's implementation to gauge the accuracy of forecasted impacts and potential readjustments to forecasts for the second rail link phase of the project should be made if necessary. In addition, a review of the actual impacts of the proposed rail links should also be made within six to nine months of implementation.

Date: 19 May 1999

Subject: **REVISED** Synopsis of 5/19/99 VDOT Traffic coordination meeting

Pursuant to our discussion, I am providing the following meeting synopsis:

People Present

VDOT: Tom Farley, Reggie Beasley, Joanne Sorenson, Chris Detmer, Elona Kastenhofer, Grady Ketron

City of Falls Church: Andrea Giberson, Hector Rivera, Otis Smith, David Holmes, Harry Reitze, Halsey Green, Gary Fuller, Samer Beidas, Wayne French

Key Points/Issues:

1. The City presented the historical information to VDOT personnel regarding the City; its issues, problems, concerns, location, and desire to be involved and

considered in any and all future transportation and traffic issues that may have an impact on the City and its citizens.

2. Mr. Fuller gave a historical background as to the City's desire and need to have traffic studies conducted, including the recently adopted Comprehensive Plan and a recently adopted resolution concerning sustainable development, which mandates the initiation of a traffic and parking study to determine the impacts of the current situation, as well as those created by new developments.
3. Captain Reitze explained the City's unusual position in regards to emergency response, as the two METRO stations are not in the City, but the City Police are often called to respond to these areas due to our proximity. Also, if the Bus Rapid Transit (BRT) system utilizes West Falls Church as a hub, then the growth in traffic will be almost debilitating. He stressed, as everyone in attendance noted, a regional approach must be taken on these issues.
4. The BRT is the one of the main reasons for the initiation of this cooperative effort and will be key in its success.
5. Mr. Rivera had met with Virginia Secretary of Transportation Shirley Ybarra and requested assistance from her for the funding of a two-year (+/-) transportation engineering position so that the impacts on the City caused by the BRT could be evaluated. This position would also allow the City to assess impacts of development on City and County highways. She expressed a desire to investigate this option based on its link to the BRT. Mr. Rivera then met with Mr. Tom Farley in response to a request to Mr. Farley from the Secretary's office.
6. The City desires to have other services performed in conjunction with this effort, including, but not limited to, traffic impact studies, level-of-service studies, congestion mitigation recommendations, safety issues, traffic calming, etc.
7. *In my conversation with Mr. Beasley, I expressed to him the City's desire to include the Village Section of West Broad Street for consideration of inclusion in the State's six-year plan, once funding becomes available in FY01. This could be accomplished by completing the downtown section, which is already on the State's project list and then including the Village Section with this project. If this is done, and the State constructs the project, the State would pay 98%, the City 2%, of the cost of most of the work, although a portion of the streetscape may be 100% City funding.*

DELIVERABLES

1. VDOT will prepare a two or three page Scope of Services to ensure that the needs of all involved are met and will have a draft to Mr. Rivera by 4 June 1999.
2. A final Scope of Services should be finished by the end of June 1999.
3. Reggie Beasley, Urban Division, Richmond, will be the coordinator for this effort to ensure that sufficient resources are assigned and that the project continues. This was done due to the fact the Reggie deals directly with the City, whereas the Northern Virginia Division does not.
4. Once an agreeable scope of services is finished, it will be sent out to bid, possibly with the City being the agent for the effort.
5. *A follow-up meeting with Secretary Ybarra, Mr. Farley, and Mr. Rivera would be established to finalize the agreement and establish the payment information and to establish the teams to correspond back and forth on the product.*
6. *The inclusion of the Village Section (400-900 blocks) of West Broad Street into the existing downtown section of Broad Street for funding and construction by*

VDOT in their six-year plan. This would complete the streetscape on all sections of West Broad Street.

February 4, 1999

The Honorable Shirley Ybarra
Secretary of Transportation
Commonwealth of Virginia
1401 E. Broad Street
Richmond, Virginia 23219

Dear Secretary Ybarra:

I have had the opportunity and privilege to serve on the Dulles Corridor Task Force which is exploring exciting approaches to BRT, funding alternatives, management approaches, etc., in order to realize a bus-rail/combo that would relieve congestion and engender continued development and technological growth. I thank you for the appointment to this important committee and for your sensitivity to local practitioners.

The plans to date reference West Falls Church as a point of expansion and/or origination for this east-west connector. In the future, the same may be true of a future northern connector from Springfield to Falls Church and to D.C. or Dulles. Our city is doing aggressive and "smart" (managed) economic development along our West Broad (Main) Street with Don Beyer of Don Beyer Volvo. We plan to develop a Technology Triangle (across from the Northern Virginia Graduate Center, near George Mason High School), conveniently located near the West Falls Church Metro station. A Marriott Assisted Living facility will be further down on Broad Street. This will be the second Marriott project in our small independent city of 2.2 square miles in the last two years.

We also host the crossroads of Routes. 29 and 7 which has the potential to be our future Town Center, and further on East Broad Street we collide into the famous Seven Corners. Route 29, known as Washington Street, is experiencing development, such as, new Falls Church Fire Station and a new State Theater (private sector).

It would be essential and imperative for the City to conduct traffic impaction studies for traffic management purposes and for community sustainability in this highly citizen-interactive community as we move towards a "regional transportation hub." I would ask that you consider a capacity-building grant to allow Falls Church to hire a professional traffic engineer/ planner, retain consultants as appropriate, and provide the citizens and developers with the anticipated and possible unanticipated consequences of development. We would be willing to provide a share of in-kind services and cash match. I project that a grant from the Commonwealth to us in the range of $175-200K may be realistic to get the job done systematically and with depth.

Thank you. I remain,

Sincerely,

Hector A. Rivera
City Manager

Re. **PUBLIC HEARING RECORD – Docket R03-6**
Town of Herndon comments on the October 2003 Supplemental Draft Environmental Impact Statement and Proposed General Plans - Revisions for the Dulles Corridor Rapid Transit Project (DCRTP)

Submission of the Town of Herndon's Transportation Improvement District Resolution and Associated Resolutions in support of Metrorail

Dear Messrs. Rohrer and Dittmeier:

On behalf of the Herndon Town Council and the citizens we serve, thank you for the opportunity to comment on the Supplemental Draft Environmental Impact Statement (EIS) and Section 4(f) Evaluation and Proposed General Plans – Revisions for the Dulles Corridor Rapid Transit Project (DCRTP). We are appreciative of the steadfast energy and outstanding leadership provided by the Virginia Department of Rail and Public Transportation (VDRPT) and the Washington Metropolitan Area Transportation Authority (WMATA) staff in your efforts to meet the transit demands and challenges facing the Commonwealth.

On August 13, 2002, the Town Council unanimously passed a resolution recommending the "Metrorail Alternative" as the Locally Preferred Alternative (LPA). The Town Council views the near-term implementation of rail transit in the Dulles Corridor as imperative. However, I wish to express several significant concerns associated with the Supplemental EIS and General Plans for the Dulles Rail.

1. **PROJECT PHASING.** At the forefront of our concerns is the proposal to construct the project in two phases with the Phase 1 terminus at Wiehle Avenue. We recognize that the Federal Transit Administration (FTA) is considering only the first phase of construction to Wiehle Avenue for the FY 2004-2009 transportation reauthorization for the primary reason that "the phasing of construction is necessary to spread the costs of construction over a longer period of time to reduce annual funding needs." The Herndon Town Council is particularly concerned with the EIS statement that "FTA may consider the subsequent phase for FTA funding in the future, but has made no commitment to do so," and that "FTA has determined that the first phase now being considered for funding has independent transportation utility even if the subsequent phase is never built."

   Moving the terminus for Phase I to Herndon-Monroe is a means to guarantee immediate value for landowners in the western end of the district. Under the current funding and construction phasing proposals, these owners face the possibility of paying taxes to support Phase 1 construction bonds for thirty years or more, even in the event of a failure to get Federal funding for any subsequent phase. Under the best case scenario, these owners would be taxed from 2004 through at least 2015 before seeing any transit facilities in the Herndon area.

   We understand the financial and operational realities of the recommended extension as well as the practical difficulties engendered by an alternative proposal to construct rail directly to the Washington Dulles Airport by bypassing a number of planned stations and constructing them in a subsequent phase. While we understand that there is no way to guarantee future Federal funding, we do assert that an equitable tax district structure can be enacted. Current possibilities under discussion include a differential rate for the western portion or a scheme where western funds are escrowed until Phase 2 Federal funding is approved. These funds could be rebated if Federal funding does not materialize.

   In short, the proposed phasing scheme provides significant uncertainties for the implementation of a future phase. The Town Council opposes a single tax district, as proposed by the LEADER group, with the phasing scheme that does not extend the system to the Herndon-Monroe Station within the first phase.

   Please enter the attached Town Council Resolution 03-G-144 of December 2, 2003 into the public hearing record for the Draft Supplemental EIS. This resolution does support the LPA but conditions Town approval of the Transportation Improvement District on a Phase 1 interim terminus at Herndon-Monroe, as a means to assure rail service to the western part of the Dulles Corridor. The Herndon resolution recommends removing language that would have allowed landowners to veto Phase 2 implementation with one or more failures to obtain federal funding. The resolution also provides for minor adjustments to the boundaries of the tax district within the Town of Herndon.

2. **HERNDON-MONROE STATION NORTH SIDE ACCESS.** The Town commented previously on the minimal nature of the improvements proposed on the north side of the Herndon-Monroe Station. To recap, the Town completed an engineering concept and feasibility study in cooperation with VDRPT as well as other project sponsors, a copy of which was furnished to the project team. On June 12, 2001, the Town Council recommended a preferred access alternative as noted in the attached Resolution. The selected alternative includes pedestrian walkways extending from the station in several directions, with a modal transfer point (Kiss and Ride) for persons arriving by bus, car-pool, van-pool, automobile and bicycle. This scheme would maximize transit ridership.

   The walkway to Herndon Parkway shown in the General Plans provides basic access. However, are bus stop slips envisioned on Herndon Parkway near the end of the pedestrian walkway? Where do bicyclists store their bicycles? Where do the kiss & ride vehicles wait? How do transit users from nearby office buildings to the east and west reach the northside touchdown? How do transit users from the office buildings north of Herndon Parkway safely cross the four-lane divided roadway? Minimal improvements such as a signalized crosswalk on Herndon Parkway and multiple pedestrian sidewalks would at least fulfill the intent of the project as described on page 6-16, Section 6.2 of the Supplemental Draft EIS.

3. **TRANSPORTATION MITIGATION IMPROVEMENTS.** Two issues should be clarified with regards to Chapter 6 - Transportation Effects, 6.2.3 Transportation Mitigation, Table 6.2.7 presented on page 6-22 and 6-23. Specifically, the table provides a summary of proposed mitigation options to include construction of an additional through lane on the northbound (NB) and southbound (SB) approaches to the westbound (WB) Dulles Toll Road ramp at Fairfax County Parkway and construction of an eastbound (EB) right turn lane onto Herndon Parkway/Van Buren Street intersection. According to the Table 6.2.7, these proposed mitigation measures are required by 2025. We believe that both of the measures are warranted and should be completed prior to the opening of the Herndon-Monroe Rail Station, rather than by 2025. A northbound right turn lane at Van Buren Street and Herndon Parkway is also a critical need prior to the opening of the Herndon Monroe Station.

4. **ROUTE 28/CIT STATION.** The Town supports the accommodation of the overpass as shown in the General Plans for the Route 28 Station, although we had hoped the overpass would be constructed as part of the station project. This new connection will greatly enhance local circulation across the Dulles Toll Road between the Center for Innovative Technology (CIT) and the approved Dulles Center Development. It will enhance station access and an incomplete road network with regards to Rock Hill Road, Horse Pen and other local streets.

I would be happy to respond to any questions you may have concerning the Town's position on these or other matters related to the development of Dulles Rail. On behalf of the Town, I wholeheartedly wish the project team and the congressional delegation continued success in working with Congress and the Federal Transit Administration.

Sincerely,

Richard C. Thoesen
Mayor

TOWN OF HERNDON, VIRGINIA

RESOLUTION

DECEMBER 2, 2003

Resolution- Determining if the Town Council Wishes Commercial, Industrial, or Multi-Unit Rental Residential Property in the Town to be Included within the Proposed Dulles Rail Transportation Improvement District.

BE IT RESOLVED by the Council for the Town of Herndon that:

1. The Town Council determines that the Town Council wishes the property in the Town of Herndon, zoned for commercial, industrial, or multi- unit rental residential uses, described in "Petition Pursuant to Virginia Code Section 33.1-431 for the creation of the Dulles Rail Transportation Improvement District" (Petition) dated August 1, 2003, to be included within the proposed Dulles Rail Transportation Improvement District (District), provided the petitioner and the Board of Supervisors of Fairfax County, respectively, make all of the following changes to the Petition and to the proposed and final resolution that creates the District:

   (a) The inclusion in the District of area at the northwest corner of Worldgate Drive and Van Buren Street that includes a sizeable office building.

   (b) The exclusion from the District of the single family residential areas west of commercial parcels that front on Victory Drive.

   (c) The exclusion from the District of the area along the east Elden Street corridor and outside the one mile radius from the Herndon-Monroe Park and Ride Station.

   (d) The extension of the interim terminus of the rail line in Phase I to the Herndon-Monroe Park and Ride Station.

   (e) Modification of Paragraph 4(f) of the Petition by removing the provision dealing with the Full Funding Grant and modifying the first sentence so that the Paragraph would read, in its entirety, "The District would continue to pursue funding for and construction of the remainder of the Transportation Improvements within the District".

2. In the absence of the petitioner and the Board of Supervisors of Fairfax County making all of the above changes in the Petition and in the proposed resolution and final resolution creating the District, the Town Council determines that the Town Council does not wish such property located within the Town to be included within the proposed District and therefore does not approve such inclusion.

3. The revised District with the changes proposed in paragraph 2 above is described in detail as follows:

The tax district boundary as it extends into the Town from the east along Baron Cameron Avenue (Route 606) would turn southward at the Town's eastern boundary rather than to the north; thence continuing southward to the W&OD Railroad Regional Park property; turning thence northwest along the park property to the end of the tax map parcel 017-1-02-0022, turning eastward a short distance along the boundary of that parcel and thence northward along the western boundary of parcel 017-1-06-00J4 to a point where it meets Herndon Parkway and continuing northward along Herndon Parkway a short distance; thence crossing Herndon Parkway and continuing west along Grove Street to an unnamed parcel shown on a plat approved April 1, 2003 (recorded at Deed Book 14224, pages 933-945) and being the location for the relocation of H and S Plumbing due to the extension of Grove Street; thence extending southward and westward along that parcel, continuing westward along subdivision 32 and thence northward returning to Grove Street; thence extending westward along Grove Street; turning southward along the eastern boundary of parcel 016-2-02-0191 and westward along the W&OD Railroad Regional Park property to Van Buren Street; thence extending southward along Van Buren Street as it becomes Spring Street; thence extending southeast along Spring Street to the northeast corner of parcel 016-2-02-0173B; thence extending southward along a line formed by that parcel and parcels 016-2-02-0174C and 016-4-02-0010C; thence turning westward along the boundary of subdivision 10 and extending along this subdivision and parcel 016-4-02-0002 (Town of Herndon property) to a point where it meets Herndon Parkway; thence continuing westward along Herndon Parkway a short distance and turning south along parcel 016-4-02-004A; thence continuing south along this parcel to its southwestern corner; thence extending northwestward along a line formed by subdivision 15 and 14 (Worldgate) and continuing thus within the Town as shown in the Petition.

4. The Mayor, any member of the Town Council, the Town Manager, or the Town Attorney shall deliver a certified copy of this resolution to the Fairfax County Board of Supervisors at or before its public hearing on the Petition on December 8, 2003.

5. This resolution shall be effective on and after the date of adoption.

This is certified to be a true and accurate copy of Resolution 03-G-144 adopted at a legally convened meeting of the Town Council of the Town of Herndon on December 2, 2003.

Viki L. Wellershaus

Viki L. Wellershaus, Town Clerk

TOWN OF HERNDON, VIRGINIA

RESOLUTION

AUGUST 13, 2002

Resolution- Recommending a Locally Preferred Alternative (LPA) and Other Considerations to be Forwarded to the Washington Metropolitan Area Transportation Authority (WMATA), the Virginia Department of Rail and Public Transportation (VDRPT) and the Commonwealth Transportation Board (CTB) as a Response to the Draft Environmental Impact Statement and Proposed General Plans of the Dulles Corridor Rapid Transit Project.

WHEREAS, the public information and public participation meetings were held concerning the Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project on July 29, July 30, and July 31, 2002 at the locations identified in the Notice of Public Hearings for the purpose of identifying issues and concerns of community members and stakeholders likely to be affected by the project, and to describe the purpose of the Study, identify the alternatives, the goals of the Study, and to increase public awareness and to receive citizens comments with regard to the Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project which includes Bus Rapid Transit and Metrorail Service in Fairfax and Loudoun Counties, Virginia; and

WHEREAS, the Town of Herndon approved a resolution, dated November 13, 2001, in support of the efforts of Congress and other leaders to expedite the extension of the Metrorail system to Washington Dulles International Airport; and

WHEREAS, the Town of Herndon approved a resolution, dated June 12, 2001, recommending a preferred alternative (Alternative Four) for north-side pedestrian access to the future Herndon-Monroe Transit Station; and

WHEREAS, the Town's preferred alternative for north-side pedestrian access to the future Herndon-Monroe Transit Station emphasizes a walkway extending from the station to Herndon Parkway, with a modal transfer point for persons arriving by bus, car-pool, van-pool, automobile and bicycle; and

WHEREAS, the Town of Herndon now has the opportunity to recommend a Locally Preferred Alternative (LPA) for the Dulles Corridor Transit Project from among the following alternatives: Baseline (No-Build) Alternative, Bus-Rapid Transit Alternative, Metrorail Alternative, Bus- Rapid Transit / Metrorail Alternative and a Phased Alternative; and

WHEREAS, the Town staff has reviewed and reported on the draft Environmental Impact Statement (EIS) and Proposed General Plans of the Dulles Corridor Rapid Transit Project; and

WHEREAS, by the year 2025, population in the Dulles Corridor is projected to increase by 56 percent, along with a 71 percent increase in jobs, and Dulles Airport, currently serving more than 20 million passengers annually, is projected to serve 32 million passengers by 2010; and

WHEREAS, based on local land use and transportation plans, this population and employment growth will lead to increased congestion on primary and local service roads and a need for additional capacity; and

WHEREAS, evaluation of the Dulles Corridor Study area has found that the corridor cannot accommodate additional highway expansion and therefore rapid rail (Metrorail Alternative) is the only mode of transportation that can provide substantial additional capacity in the corridor to meet future travel demand; and

NOW, THEREFORE, BE IT RESOLVED by the Town Council of the Town of Herndon that the Metrorail Alternative is the Locally Preferred Alternative, which provides for Metrorail service that would extend the full length of the corridor from a point between the East and West Falls Church Metrorail stations on the Orange Line to Route 772 in Loudoun County.

BE IT FURTHER RESOLVED that:

1. The Town Council requests that the Herndon-Monroe Station construction include necessary facilities for inter-modal transfers and adequate pedestrian facilities on the north-side of the station, and that such facilities be incorporated into the final Environmental Impact Statement for the Dulles Corridor Rapid Transit Project; and

2. The Town of Herndon supports federal, state and local officials working together to achieve full funding for the Metrorail Alternative from federal, state and local sources.

This is certified to be a true and accurate copy of Resolution 02-G-98 adopted at a legally convened meeting of the Town Council of the Town of Herndon on August 13, 2002.

TOWN OF HERNDON, VIRGINIA

RESOLUTION

JUNE 12, 2001

Resolution- Recommending a Preferred Alternative for Northside Pedestrian Access to the Future Herndon-Monroe Transit Station.

WHEREAS, on July 18, 2000, the Town Council awarded a contract to Parsons Transportation Group to prepare a study of alternatives for northside access to the Herndon-Monroe Transit Station; and

WHEREAS, on November 21, 2000, the Planning Commission and Town Council held a joint work session and heard a presentation by the consultant about the preliminary findings of the study and provided comments to the consultant; and

WHEREAS, the Planning Commission has reviewed the Herndon-Monroe Transit Station Northside Access Study, the staff report and attachments; and

WHEREAS, on March 5, 2001, the Planning Commission held a public hearing on the Herndon-Monroe Transit Station Northside Access Study; and

WHEREAS, the Town Council has reviewed the Herndon-Monroe Transit Station Northside Access Study, the staff report and attachments; and

WHEREAS, on June 12, 2001, the Town Council held a public hearing on the Herndon-Monroe Transit Station Northside Access Study; and

WHEREAS, notice of the public hearing was advertised in accord with Section 15.2-2204 of the Code of Virginia (1950) as amended.

NOW, THEREFORE, BE IT RESOLVED by the Town Council of the Town of Herndon that:

1. The Town Council approves the Herndon-Monroe Northside Access Study, dated January 26, 2001, prepared by Parsons Transportation Group, Inc., which recommends Alternative Four as the preferred configuration to be explored in more detail with the Virginia Department of Rail and Public Transportation.

2. The Town Council directs the Town Manager to transmit the Herndon-Monroe Northside Access Study, dated January 26, 2001, to the Virginia Department of Rail and Public Transportation for its reference in preparing the Final Environmental Impact Statement for the study of rail in the Dulles Corridor.

This is certified to be a true and accurate copy of Resolution 01-G-57 adopted at a legally convened meeting of the Town Council of the Town of Herndon on June 12, 2001.

RE: PUBLIC HEARING RECORD – Docket R02-1
Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project (DCRTP).

0409 L

Submission of the Town of Herndon's Locally Preferred Alternative (LPA) resolution and associated resolutions in support of Metrorail

Dear Mr. Hill:

On behalf of the citizens of the Town of Herndon, I am pleased to submit the attached resolutions to be entered into the Public Hearing Record for the Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project (DCRTP).

On August 13, 2002, the Town Council of the Town of Herndon unanimously passed the attached resolution recommending the "Metrorail Alternative" as the Locally Preferred Alternative (LPA) to be forwarded to the Virginia Department of Rail and Public Transportation (VDRPT), the Washington Metropolitan Area Transportation Authority (WMATA), and the Commonwealth Transportation Board (CTB).

The Town Council views the near-term implementation of rapid transit in the Dulles Corridor as imperative. The Town Council is in full support of the effort to bring Metrorail to the Dulles Corridor due to the capacity limitations of Bus Rapid Transit and the disruption issues associated with phased implementation. During the past few years, we have been looking closely at the important Herndon-Monroe Station proposal and how to best develop pedestrian and vehicular access to the station from the Town of Herndon. This effort resulted in the Town completing an engineering concept and feasibility study in cooperation with VDRPT as well as other project sponsors.

On June 12, 2001, the Town Council unanimously passed a resolution recommending a preferred alternative for direct access from the Town to the future Herndon-Monroe Transit Station. The Town's selected alternative is referred to as Alternative #4 and, as stated in the attached resolution, it is the preferred configuration to be explored in more detail with Virginia Department of Rail and Public Transportation. This alternative emphasizes a pedestrian walkway extending from the station to the north, directly into Herndon, with a modal transfer point for persons arriving by bus, car-pool, van-pool, automobile and bicycle.

The Town Council believes that enhanced pedestrian and vehicular access on the north side should be a part of the station development scheme from the beginning. Effective north side access to the station will have beneficial impact on Town property values and the quality of life of residents and person working in the Town, over the long term, especially if appropriate redevelopment of the transit station area is implemented during the coming years.

It is my hope that through the auspices of the Virginia Department of Rail and Public Transportation and the Washington Metropolitan Area Transit Authority that the Metrorail Alternative and the Town's preferred Herndon-Monroe station access alternative will maximize transit ridership while contributing to high-quality transit-oriented development within the Town of Herndon.

The Town wishes the Virginia Department of Rail and Public Transportation, the Washington Metropolitan Area Transit Association and the Commonwealth Transportation Board success in submitting the DCRTP - Environmental Impact Statement and Proposed General Plans to the Federal Transit Administration during the coming months.

I would be happy to respond to any questions you may have concerning the Town's position on these or other matters related to the development of the Dulles Corridor Rapid Transit Project.

Sincerely,

Rick Thoesen

Richard C. Thoesen
Mayor

TOWN OF HERNDON, VIRGINIA

RESOLUTION

NOVEMBER 13, 2001

Resolution– Town of Herndon Support of the Efforts of Congress and Other Leaders to Expedite the Extension of the Metrorail System to Washington Dulles International Airport.

WHEREAS, the Town of Herndon is located along the Dulles Corridor, with Washington Dulles International Airport located two miles to the west and the nation's capital and seat of government located twenty-two miles to the east; and

WHEREAS, Washington Dulles International Airport is an important part of the transportation infrastructure of the National Capital region during times of peace as well as times of crisis; and

WHEREAS, the terrorist attacks of September 11, 2001 threatened the security of the National Capital region and made us aware that we lack adequate mobility to meet emergency circumstances; and

WHEREAS, the national security of the United States requires that the National Capital region function efficiently in times of crisis or emergency; and

WHEREAS, the Metrorail System functioned efficiently in evacuating people from Washington D.C. after the attacks of September 11, 2001; and

WHEREAS, citizens of United States and others from throughout the world need to be able to visit the National Capital region in a safe and efficient manner during times of peace as well as times of crisis; and

WHEREAS, members of Congress and other leaders have determined that it is strongly in the interest of the United States to expedite extension of Metrorail to Dulles Airport and Loudoun County to enhance mobility in the National Capital region.

NOW, THEREFORE, BE IT RESOLVED by the Town Council of the Town of Herndon, Virginia that it:

1. Supports the efforts of members of Congress and other leaders to expedite the extension of the rail system to Washington Dulles International Airport.

2. Encourages the Federal Transit Administration to work with the Commonwealth of Virginia and local governing bodies to develop a plan to expedite extension of the rail system to Washington Dulles International Airport.

BE IT FURTHER RESOLVED that the Town of Herndon supports federal, state, and local officials working together to achieve full funding for the Dulles Rail Project from federal, state, and local sources, including proposed federal funding contained in legislation currently under consideration as part of the federal response to the terrorist attacks.

This is certified to be a true and accurate copy of Resolution 01-G-119 adopted at a legally convened meeting of the Town Council of the Town of Herndon on November 13, 2001.

RE: **Town of Herndon Review of the Dulles Corridor Rapid Transit Project (DCRTP), 95% Draft - Environmental Impact Study**

Dear Mr. Dittmeier:

Thank you for the opportunity to review the 95% Draft - Environmental Impact Study for the Dulles Corridor Rapid Transit Project (DCRTP). The Town staff and I are impressed with the comprehensiveness of the EIS evaluation and the many environmental and socioeconomic aspects associated with implementing this project.

I would like to take this opportunity to thank Mr. Neil Nott and Dr. Ramen De for meeting with our Community Development staff on February 26, 2002 to address specific concerns with the Draft EIS and to discuss a few of the transit and pedestrian access design elements of the future Herndon-Monroe Station. Town staff has completed its review of the eleven technical EIS reports and determined that there are two issues that should be clarified; both of which were discussed during the meeting and are further described below:

1. The 'Traffic Analysis and Station Access EIS Technical Report' states: *On the north side of the Dulles Toll Road, it is assumed that the Town of Herndon is providing a small Kiss & Ride and bus transfer facility in what is currently a private parking lot.* However, the Town's position is to convey that there are no current plans to fulfill this assumption.

2. The 'Land Use EIS Technical Report' delineates a Station-Access Study Area whereby it does not accurately represent the Town's recently approved land-use changes. Specifically, Town Council approved a major development project (Quadrangle - Fairbrook Business Park) which, when completed, will have three buildings totaling 525,000 sq.ft. of floor area. This development will be located within 1,500 feet of the Herndon-Monroe station platform (Tax Map: 16-4-010-5B) Consequently, the additional density and it effects on ridership modeling and traffic impact should be considered during final EIS preparation. As discussed during the meeting, redevelopment in the Station-Access Study Area is expected to change dramatically within the next twenty-five to fifty years. Indeed, office development within the Town has outpaced recent rounds of the MWCOG cooperative land use forecasts.

With regard to our discussions concerning Alternative #4 for Herndon's north side access, we have been advocating that enhanced transit, pedestrian and vehicular access on the north side should be a part of the station development from the beginning. Such access would emphasize a modal-transfer point for persons arriving by bus, car-pool, van-pool, automobile and bicycle.

Although, it was disappointing to learn that a transfer facility would not be included in the initial plans, it was nevertheless refreshing to hear positive feedback regarding the potential for a bus-drop off facility, similar to the plans developed for the north access at the Reston Parkway Station. Such an arrangement for a bus-drop off facility along Herndon Parkway will provide a safe, efficient and convenient transit drop-off point for pedestrians wishing to access the station.

The Town Council fully supports the effort to bring bus and rail transit to the Dulles Corridor. Consequently, the Town of Herndon looks forward to the opportunity of constructing a transfer facility in the context of a future public-private redevelopment venture adjacent to the station. Effective north side access to the station will have beneficial impacts on Town property values and the quality of life of residents and person working in the Town, over the long term, especially if appropriate transit oriented redevelopment of the transit station area is implemented during the coming years. With WMATA's expertise the Town will be developing plans to encourage such a TOD redevelopment scenario.

The Town wishes the Washington Metropolitan Area Transit Association success in its endeavors in submitting the DCRTP - Draft EIS Technical Reports to the Federal Transit Authority during April 2002. I would be happy to respond to any questions you may have concerning the Town's position on these or other matters related to the development of the Dulles Corridor Rapid Transit Project.

Sincerely,

John E. Moore
Town Manager

Subject: Town of Herndon comments for the scoping deadline August 10, 2000

Dear Mr. Alfredson:

We appreciate the opportunity to participate in the Preliminary Engineering–National Environmental Policy Act process for the Dulles Corridor Rapid Transit Project. I offer the following comments on behalf of the Town of Herndon.

The Town of Herndon participated in the Dulles Corridor Transportation Study and continues to participate in the Dulles Corridor Task Force. We support the findings of the original Major Investment Study, namely the extension of a Metro-like rail system in the Dulles Corridor. We also support the MIS Supplement addressing Bus Rapid Transit as part of a phased transition to rail transit. The Town supports the Herndon-Monroe and CIT-Herndon (Route 28) station locations as well as the other stations confirmed in the MIS Supplement. We assert that the Route 28 station would be essential if, for any reason, the system were to develop without the Loudoun County stations. The Town does not support options where Dulles Airport is the system terminus and Herndon-Monroe is the de facto system terminus in terms of Park and Ride and vehicular access facilities.

The Town advocates the provision of enhanced northside access to the Herndon-Monroe Station (BRT and Rail), except under scenarios where the transit system terminates at Dulles Airport and there is no CIT-Herndon (Route 28) station. Good access to all four of the Reston-Herndon stations from both sides of the Toll Road will enhance pedestrian/bicycle use and help distribute and mitigate local traffic impacts in the corridor.

We advocate that a pedestrian entrance be provided at the Herndon-Monroe Station into the Town of Herndon, along with enhanced pedestrian and vehicular access facilities connecting Herndon Parkway and/or Van Buren Street to the station. Given that all of the northside properties bordering the Dulles Toll Road at the station location are fully developed, we request that the Rapid Transit Project undertake the capital improvements to retrofit access facilities into these properties. This may include the

construction of access ramps and structured parking to accommodate the relocation of a modest quantity of existing surface parking. The Town does not support the development of parking facilities to accommodate automobiles on the north side of the Herndon-Monroe Station.

As noted in the Scoping Information Packet, The Town has initiated the Herndon-Monroe Station Northside Access Study. This is a collaborative concept design and feasibility effort that we intend to conclude early in 2001. This effort will devise and evaluate various means of providing enhanced pedestrian, bicycle, automobile and bus access to the station from areas to the north of the Toll Road. This study is expected to result in a decision by the Herndon Town Council on a preferred access alternative and concept design. A formal request for construction of these facilities will be submitted during the "Selection of Viable Alternatives" stage of the PE/NEPA process.

Office development within the Town has outpaced recent rounds of the MWCOG cooperative land use forecast as well as exceeding the projections included in the Major Investment Study. If current data on existing and pipeline development within the Town are needed for this study, please contact Mr. Dana Heiberg, our Transportation Program Manager.

Thank you for considering these comments.

Sincerely,

Henry G. Bibber

Mr. Karl Rohrer
Deputy Project Director
Virginia Department of Rail and Public Transportation
1550 Wilson Boulevard, Suite 300
Arlington, Virginia 22209

Dear Mr. Rohrer:

On February 24, 2004, the Leesburg Town Council approved a resolution supporting express bus service among Leesburg, Loudoun County, Washington, DC, and Rosslyn, Virginia. A copy of the resolution is attached.

Transportation is a high priority for the Town of Leesburg. Many residents commute to other areas of Northern Virginia via express buses. The Town Council supports the current express bus service, as well as other alternative forms of transportation to help address Northern Virginia's regional traffic problems.

The Town Council appreciates the public outreach effort of the Virginia Department of Rail and Transportation on the Dulles Corridor Transportation Project. The town respectfully requests correction of error published in the draft EIS stating that premium bus service will replace current express bus service in Loudoun County. We understand from Loudoun County that the error will be corrected in the final publication and will reflect continued express bus service. On behalf of the residents of our town, thank you in advance for your wiliingness to correct that error and support the long-term planning required to address our region's transportation needs.

Very truly yours,

Robert S. Noe, Jr.

PRESENTED February 24, 2004

RESOLUTION NO. 2004-27

ADOPTED February 24, 2004

A RESOLUTION: SUPPORTING EXPRESS BUS SERVICE AMONG LEESBURG, LOUDOUN COUNTY, WASHINGTON, DC, AND OTHER PORTIONS OF NORTHERN VIRGINIA

WHEREAS, the Town Council of the Town of Leesburg supports express bus service from Leesburg and Loudoun County to Washington, DC and areas in Northern Virginia; and

WHEREAS, many Leesburg and Loudoun County residents rely on commuter bus service to help reach employment centers throughout the Washington Metropolitan area; and

WHEREAS, alternative modes of transportation like commuter bus service help address the region's transportation needs; and

WHEREAS, the Town Council has supported Bus Rapid Transit west of Leesburg with a station in the Route 7/Route 9 corridor and a station in Leesburg adjacent to the Dulles Greenway; and

WHEREAS, the Town recognizes that an administrative error was made during the publication of the draft Environmental Impact Statement for the Dulles Corridor Transit Project, incorrectly stating that premium bus service would replace the current express bus services in Loudoun County.

WHEREAS, the Town recognizes that Loudoun County has confirmed that the Department of Rail and Public Transportation is aware of the error and committed to make a correction in the final publication, with subsequent County letter confirming that correction.

A RESOLUTION: SUPPORTING EXPRESS BUS SERVICE AMONG LEESBURG, LOUDOUN COUNTY, WASHINGTON, DC, AND OTHER PORTIONS OF NORTHERN VIRGINIA

THEREFORE RESOLVED by the Council of the Town of Leesburg in Virginia as follows:

The Mayor and Town Council of the Town of Leesburg support express bus service among Leesburg, Loudoun County, Washington, DC, and Rosslyn, as a viable alternative to address the region's transportation needs;

THEREFORE FURTHER RESOLVED, that the Mayor and Town Council support the continuation of current express bus service until completion of implementation of future modes of transportation like bus rapid transit and extended Metrorail services outlined in the Dulles Corridor Rapid Transit Project.

PASSED this 24th day of February 2004.

Kristen C. Umstattd, Mayor
Town of Leesburg

Arlington, Virginia 22209

RE: Federal Consistency Determination for Dulles Corridor Rapid Transit Project
DEQ-04-179F

Dear Mr. Rohrer:

The Commonwealth of Virginia has completed its review of the federal consistency determination listed above. The Department of Environmental Quality is the lead agency for Virginia's review of federal consistency determinations submitted pursuant to the Coastal Zone Management Act. The following agencies joined in this review:

Department of Environmental Quality (hereinafter "DEQ")
Department of Game and Inland Fisheries
Department of Conservation and Recreation
Marine Resources Commission
Department of Historic Resources.

Project Description

The Federal Transit Administration (part of the U.S. Department of Transportation), Washington Metro Area Transit Authority, and Virginia Department of Rail and Public Transportation propose to extend the Metrorail transit system 23 miles west from the West Falls Church station past Dulles Airport into Loudoun County. The project would include the construction of 11 new stations, 23 stormwater facilities, 21 traction power substations, 6 tie-breaker stations, 8 potential staging areas, and six existing and planned parking facilities. This is the Locally Preferred Alternative as described in an earlier Supplemental Draft EIS prepared for this project. DEQ

coordinated previous reviews of the Draft EIS (DEQ-02-124F, comments mailed August 27, 2002) and the Supplemental EIS (DEQ-03-210F, comments mailed December 18, 2003) for this project.

Federal Consistency under the Coastal Zone Management Act

Pursuant to the Coastal Zone Management Act of 1972, as amended, federal activities located inside or outside of Virginia's designated coastal management area that can have reasonably foreseeable effects on coastal resources or coastal uses must, to the maximum extent practicable, be implemented in a manner consistent with the Virginia Coastal Resources Management Program (VCP). The VCP consists of a network of programs administered by several agencies. The DEQ coordinates the review of federal consistency determinations with agencies administering the Enforceable and Advisory Programs of the VCP.

Based on the information submitted and the comments of reviewing agencies, we concur that the proposed activity is consistent with the Virginia Coastal Resources Management Program, provided that the proponent agencies and their contractors comply with all applicable requirements.

The following Enforceable Policies of the Virginia Coastal Resources Management Program do not apply to this project:

Dunes Management
Shellfish Sanitation
Point-Source Pollution Control.

The other Enforceable Policies will, or may, apply to the project according to the following discussions.

1. Fisheries Management. According to the consistency determination (in its discussion of Subaqueous Lands Management; see next item), the alignment of the project would cross ten streams in Fairfax and Loudoun Counties (page 3, item b).

(a) In-stream Project Activities. Project activities taking place in streams should be undertaken in low-flow conditions in accordance with the following guidance, according to the Department of Game and Inland Fisheries:

- Use non-erodible cofferdams to isolate the construction area;

- Block no more than 50% of the streamflow at any given time;

- Stockpile excavated material in a manner that prevents its re-entry into the stream;
- Restore original streambed and streambank contours;
- Re-vegetate barren areas with native vegetation; and
- Implement strict erosion and sediment control measures (see item 4, below).

In addition, the Department of Game and Inland Fisheries prefers stream crossings to be constructed by way of clear-span bridges where possible, in order to reduce future maintenance costs, loss of floodplains, and loss of aquatic habitat attributable to culverts. If the avoidance of culverts is not possible, then culverts should be counter-sunk at least six (6) inches below the streambed to allow passage of aquatic organisms. Alternatively, bottomless culverts could be used.

Most, if not all, of the foregoing practices also serve to protect water quality (see item 3, below).

(b) Mussel Surveys. As a pre-requisite to conducting project activities affecting perennial streams, the Department of Game and Inland Fisheries recommends that the proponent agencies and their contractors undertake mussel surveys. These should be conducted 200 meters upstream and 800 meters downstream of the impact areas. The surveys should be accomplished within 6 months prior to initiation of the project.

All mussels encountered within the impact area must be relocated upstream into suitable habitat. Relocation should occur as close to the time of initiation of the project activity as possible, in order to avoid or minimize the chance that mussels will colonize the work area. Any listed species should be tagged for further monitoring. Before relocating any state-listed or federally listed species, the proponents or their contractors must contact the Department of Game and Inland Fisheries (Brian Watson, mussel biologist, telephone (434) 525-7522) and, in the case of federally listed species, the U.S. Fish and Wildlife Service's Virginia office as well (telephone (804) 693-6694).

(c) Wood Turtle Concerns. The streams affected by the project would include Pimmit Run, Difficult Run, and Sugarland Run in Fairfax County. These streams are designated as Threatened and Endangered Species Waters, according to the Department of Game and Inland Fisheries, because of the occurrence of the wood turtle, which is listed as a threatened species by the Department of Game and Inland Fisheries. See "Advisory Policies and Other Environmental Issues," items 2(b) and 2(c), below.

2. Subaqueous Lands Management. The Marine Resources Commission has jurisdiction over any encroachments in, on, or over state-owned rivers, streams, or creeks. Accordingly, a permit may be required from the Commission (Ben McGinnis, telephone (757) 247-2200) for any such encroachments.

3. Wetlands Management. According to the consistency determination, the project will affect approximately 5.2 acres of wetlands (page 2, "Water Resources" heading). Given the amount of wetland impacts contemplated, an individual Virginia Water Protection Permit may be required from DEQ. Applicability of this permit will depend on not only the types of permits to be issued by the Army Corps of Engineers, Norfolk District ("Corps") pursuant to the Clean Water Act, but also on the phasing of project implementation; more than one permit action may be required for different parts of the Corridor project. DEQ's Division of Water Quality, which has responsibility for permitting of linear projects such as railroads and roads, will work with the Corps, the proponent agencies, and DEQ's Northern Virginia Regional Office to ensure that appropriate permits are secured and that wetland impacts are avoided and minimized to the maximum extent practicable.

The consistency determination also addressed avoidance and minimization of wetlands impacts and committed the proponent agencies to compensatory mitigation measures (page 4, item c). Final determination of the sufficiency of these measures must await the permit process. DEQ's Division of Water Quality recommends strict adherence to erosion and sediment controls and stormwater management practices (see item 4, below) and encourages the proponent agencies to monitor construction activities to make certain that these controls and practices effectively prevent the entry of sediment and pollution into surface waters and wetland areas.

As part of the wetland permitting process, it will be necessary for the proponent agencies to obtain a wetland confirmation letter from the Army Corps of Engineers, Norfolk District. This letter will be valid for five years after it is issued.

To start the permitting process, the proponent agencies must file a Joint Federal-State Permit Application (JPA) with the Marine Resources Commission (2600 Washington Avenue, Newport News, 23607). Questions on this process may be directed to the Corps (above), the Commission (Tony Watkinson, telephone (757) 247-2200), or DEQ's Division of Water Quality (Ellen Gilinsky, telephone (804) 698-4375).

4. Non-point Source Pollution Control. Federal agencies and their authorized agents conducting regulated land-disturbing activities on public and private lands in the Commonwealth of Virginia must comply with the Virginia Erosion and Sediment Control Law, the Virginia Stormwater Management Law, and other applicable federal non-point source pollution control mandates such as section 313 of the Clean Water Act and the

federal consistency requirements of the Coastal Zone Management Act. Clearing and grading activities, installation of staging areas, parking lots, roads, buildings, utilities, or other structures, soil/dredge spoil areas, or related land conversion activities that disturb 10,000 square feet or more (2,500 square feet or more in Chesapeake Bay Preservation Areas) are regulated by the Erosion and Sediment Control Law and its implementing regulations. Similar activities that disturb one acre or more are regulated by the Stormwater Management Law and its implementing regulations. Accordingly, the Federal Transit Administration and other project proponents should prepare and implement Erosion and Sediment Control Plans and Stormwater Management Plans that comply with state law. The Federal Transit Administration is ultimately responsible for achieving project compliance through oversight of on-site contractors, regular field inspection, prompt action against non-compliance, and/or other mechanisms consistent with Federal Transit Administration policy. For additional information, the project proponents may contact the Department of Conservation and Recreation's Potomac Watershed Office (Shelby Hertzler, telephone (540) 351-1589) and local authorities (Basant Sood, Fairfax County Department of Public Works and Environmental Services, telephone (703) 324-1950; and Marie Genovese, Loudoun County Department of Planning, telephone (703) 737-8798).

5. Air Pollution Control. DEQ's Air Division reiterates its earlier guidance regarding open burning and fugitive dust emissions, as follows.

(a) Fugitive Dust Control. During construction, fugitive dust must be kept to a minimum by using control methods outlined in 9 VAC 5-50-60 et seq. of the Regulations for the Control and Abatement of Air Pollution. These precautions include, but are not limited to, the following:

- Use, where possible, of water or chemicals for dust control;
- Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials;
- Covering of open equipment for conveying materials; and
- Prompt removal of spilled or tracked dirt or other materials from paved streets and removal of dried sediments resulting from soil erosion.

(b) Open Burning Requirements. In addition, if project activities include the burning of any material, this activity must meet the requirements of the Regulations for open burning (9 VAC 5-40-5600 et seq.), and it may require a permit from DEQ's Northern Virginia Regional Office (Mr. Terry Darton, Air Permits Manager, telephone (703) 583-3845). The Regulations provide for, but do not require, the local adoption of a model ordinance concerning open burning. The project proponents should contact appropriate Loudoun County and/or Fairfax County officials to determine what local

requirements, if any, exist. The model ordinance includes, but is not limited to, the following provisions:

- All reasonable effort shall be made to minimize the amount of material burned, with the number and size of the debris piles;
- The material to be burned shall consist of brush, stumps and similar debris waste and clean-burning demolition material;
- The burning shall be at least 500 feet from any occupied building unless the occupants have given prior permission, other than a building located on the property on which the burning is conducted;
- The burning shall be conducted at the greatest distance practicable from highways and air fields;
- The burning shall be attended at all times and conducted to ensure the best possible combustion with a minimum of smoke being produced;
- The burning shall not be allowed to smolder beyond the minimum period of time necessary for the destruction of the materials; and
- The burning shall be conducted only when the prevailing winds are away from any city, town or built-up area.

6. Coastal Lands Management. According to the Department of Conservation and Recreation's Division of Chesapeake Bay Local Assistance, the project proponents appear cognizant of the requirements of the Chesapeake Bay Preservation Act as locally implemented, and the consistency determination indicates the proponents' intention of complying with these requirements. Provided that this compliance takes place, the project will be consistent with the Chesapeake Bay Preservation Act (*Virginia Code* sections 10.1-2100 et seq.) and the Chesapeake Bay Preservation Area Designation and Management Regulations (9 VAC 10-20-10 et seq.). It should be noted that the Act and the Regulations apply in Fairfax County but not in Loudoun County.

Advisory Policies and Other Environmental Issues

1. Historic Structures and Archaeological Resources. Pursuant to section 106 of the National Historic Preservation Act, the Department of Historic Resources has been consulting with the U.S. Department of Transportation (USDOT) and other agencies on this project. There is a signed Memorandum of Agreement. The Department of Historic Resources asks that the proponent agencies comply with the stipulations of the agreement as the project is implemented. For more information, the project proponents may contact the Department (Marc Holma, telephone (804) 367-2323, extension 114).

2. Wildlife Resources. In general, wood turtles could be encountered throughout the vicinity of the proposed project, particularly in association with streams and riparian

zones. It is a violation of Virginia protected species law to harm, or to keep for personal possession, a wood turtle.

For these reasons, the Department of Game and Inland Fisheries recommends that all project contractors be trained in the identification and natural history of wood turtles prior to the start of the project. If any wood turtles are encountered during the development of the project and jeopardized by it, they should be removed from the project site and returned safely to suitable habitat, i.e., a run or deep pool in a perennial stream with a sandy or muddy bottom and submerged roots, branches, or logs. The stream should be in the same watershed as the place where the turtle was found. The contractors or finders should then contact the Department of Game and Inland Fisheries (telephone (804) 367-8999).

The Department of Game and Inland Fisheries recommends that an information sheet be provided to contractors. The information sheet should include a photograph of a wood turtle and the following text accompanying the photograph (both text and photograph are available on the Department's website; see below):

> The wood turtle is a State Threatened species that may be found in or near the project area.
>
> *Description:* A medium-sized semi-terrestrial turtle, adults are 6-8 inches long. The dull brown upper shell is very rough; each section of the shell is composed of growth rings that form an irregular pyramid. The bottom shell is yellow with black blotches. The turtle has a black head and dark brown extremities. The yellow to burnt orange skin on the neck and in the leg sockets is a distinguishing characteristic.
>
> If one of these turtles is found within the project area, it should be carefully removed to safety in suitable habitat (a run or deep pool with sandy or muddy bottom and submerged roots, branches, or logs) in the same watershed (i.e., Sugarland Run, Pimmit Run, or Difficult Run).
>
> It is a violation of Virginia law to harm, or keep for personal possession, a wood turtle. If you have questions concerning this species, call the Virginia Department of Game and Inland Fisheries at (804) 367-8999.

Additional information on wood turtles, including a photograph, may be found at the following web site:

- http://www.dgif.state.va.us/wildlife/species/display.asp?id030062.

3. Natural Heritage Resources. The Department of Conservation and Recreation has searched its Biotics Data System for occurrences of natural heritage resources in the project area shown on the maps submitted with the consistency determination. "Natural

heritage resources" are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, significant geologic formations, and similar features of scientific interest. The proposed Metrorail corridor crosses the Broad Run-Route 607 Stream Conservation Unit. It also crosses Difficult Creek just upstream from the Difficult Run Stream Valley Park Conservation Site. Discussion of these features, and natural heritage resources documented therein, follows.

(a) Stream Conservation Units. Stream Conservation Units (SCUs) identify stream reaches that contain aquatic natural heritage resources. The units extend 2 miles upstream and 1 mile downstream of documented occurrences, and cover all tributaries within this reach. SCUs are given a bio-diversity significance ranking based on the rarity, quality, and number of occurrences they contain. The Broad Run-Route 607 SCU has been given a bio-diversity ranking of B5, which means a site of general bio-diversity significance. The natural heritage resource associated with this site is the yellow lampmussel (*Lampsilis* cariosa).

The yellow lampmussel averages about 70 millimeters (mm) in length, but can reach 130 mm (Johnson, 1970). This species is found in larger streams and rivers where good currents exist over a sand and gravel substrate, and in small creeks and ponds. The species is known to occur in the Potomac, York, and Chowan river basins (TNC, 1996). The species is classified as a special concern species by the Department of Game and Inland Fisheries.

Freshwater mussels are considered good indicators of the health of aquatic ecosystems. They depend on good water quality, good physical habitat conditions, and an environment that supports populations of host fish species. Mussels, as sedentary organisms, are sensitive to water quality degradation from sedimentation and pollution. They are also sensitive to habitat destruction attributable to dam construction, channelization, and dredging; and they are sensitive to the invasion of exotic mollusk species.

(b) Conservation Sites. Conservation sites are tools for representing key areas of the landscape warranting further review for possible conservation action because of the natural heritage resources they support. Conservation sites are polygons built around one or more rare plant or animal species or natural communities. They are designed to include the resource and, where possible, its associated habitat and a buffer area thought necessary for resource preservation. Conservation sites are given a bio-diversity significance ranking based on the rarity, quality, and number of occurrences they contain. The ranking is from 1 to 5, with 1 being the most significant. The Difficult Run Stream Valley Conservation Site is ranked B5, which represents a site of general bio-diversity significance. The natural heritage resource documented in this site is the wood turtle (*Glyptemys insculpta*) (see item 2, above).

The wood turtle inhabits forested floodplains and nearby fields, wet meadows, and farmlands (Mitchell, 1994). This species spends winters on the bottoms of creeks and streams, so water is a primary habitat requirement. As indicated above, the wood turtle is classified as a threatened species by the Department of Game and Inland Fisheries.

(c) Recommendations. The Department of Conservation and Recreation recommends strict adherence to erosion and sediment control requirements during land-disturbing activities in order to minimize adverse impacts upon the aquatic ecosystem in the vicinity of project activities. In addition, the Department recommends that the proponent agencies contact the Department of Game and Inland Fisheries (telephone (804) 367-8999) for additional guidance on protecting the wood turtle.

(d) Additional Information. The Department of Game and Inland Fisheries also maintains a database of wildlife locations which includes endangered and threatened species, trout streams, and anadromous fish waters. This database may include information not documented by the Department of Conservation and Recreation. The Department of Game and Inland Fisheries maintains this database at the following web site:

- http://www.dgif.virginia.gov/wildlife/info_map/index.html.

Questions on this database may be addressed to the Department of Game and Inland Fisheries (Shirl Dresser, telephone (804) 367-6913).

4. Land Development; Stormwater General Permit. Because the project will disturb more than 1 acre of land area, it will require a Virginia Pollutant Discharge Elimination System (VPDES) Stormwater General Permit for construction activities from DEQ. The project proponents should contact DEQ's Northern Virginia Regional Office (John Bowden, telephone (703) 583-3880) in this regard. It is likely, depending on the timing and implementation of various phases of the project, that multiple permits will be needed.

5. Recreation Resources. The Department of Conservation and Recreation indicates that the Dulles Corridor project will not affect any state recreation resources, Natural Area Preserves, or state scenic areas.

Thank you for the opportunity to review this consistency determination. If you have any questions, please feel free to call me (telephone (804) 698-4325) or Charlie Ellis of this Office (telephone (804) 698-4488).

Sincerely,

Ellie L. Irons

SUBJECT: Coastal Consistency Determination (CCD)
Dulles Corridor Rapid Transit Project
04-179F

We have reviewed the information provided concerning the above-referenced project. The purpose of the project is to extend the current Metrorail system 23 miles into the Dulles Corridor of Northern Virginia. The preferred alternative includes the construction of eleven new stations, twenty-three stormwater facilities, twenty-one traction power substations, six tiebreaker stations, eight potential construction staging areas, and six existing and planned parking facilities.

According to the report, (page 2) approximately 5.2 acres of wetlands will be impacted by the project. Given the amount of wetland impacts proposed, an individual Virginia Water Protection permit application may be required. It appears that avoidance and minimization of wetland impacts to the maximum extent practicable were addressed in the report; however, the final determination is made during permit application review. Further, the amount, type, and location of compensatory wetland mitigation is also conducted during permit application review and is based upon the ecologically preferable alternative. A Corps of Engineers wetland confirmation letter needs to be provided during the permitting review process. The wetland confirmation is valid for five years. A Joint Permit Application should be sent to Virginia Marine Resources Commission and the project proponent should coordinate with the DEQ Central Office for final permit determination.

Should the size or scope of the project change, additional review may be necessary. We recommend strict adherence to erosion and stormwater management practices, and further encourage the project proponent to monitor construction activities to make certain that erosion and stormwater management practices are adequately preventing sediment and pollutant migration into surface waters, including wetlands. A VPDES stormwater general permit for construction activities will be required should the project disturb one or more acres of land.

Richmond, Virginia 23219

Subject: DEQ# 04-179F: Dulles Corridor Rapid Transit Project

Dear Mr. Ellis:

The Department of Conservation and Recreation (DCR) functions to preserve and protect the environment of the Commonwealth of Virginia and advocate the wise use of its scenic, cultural, recreation and natural heritage resources. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, state unique or exemplary natural communities, significant geologic formations and similar features of scientific interest.

DCR has searched its Biotics Data System for occurrences of natural heritage resources from the area outlined on the submitted map. According to the information currently in our files, the proposed metrorail corridor crosses the Broad Run – Route 607 Stream Conservation Unit. Stream Conservation Units (SCUs) identify stream reaches that contain aquatic natural heritage resources, including 2 miles upstream and 1 mile downstream of documented occurrences, and all tributaries within this reach. Stream Conservation Units are given a biodiversity significance ranking based on the rarity, quality, and number of element occurrences they contain. The Broad Run – Route 607 SCU has been given a biodiversity ranking of B5, which represents a site of general biodiversity significance. The natural heritage resource associated with this site is the yellow lampmussel (*Lampsilis cariosa*, G3G4/S2/NL/SC).

The yellow lampmussel (*Lampsilis cariosa*, G3G4/S2/NL/SC) averages about 70 mm in length but can reach a length of 130 mm (Johnson, 1970). The yellow lampmussel is found in larger streams and rivers where good currents exist over a sand and gravel substrate and in small creeks and ponds. This species is known to occur in the Potomac, York, and Chowan river basins (TNC, 1996). Please note that this species is currently classified as a special concern species by

the Virginia Department of Game and Inland Fisheries (VDGIF); however, this designation has no official legal status.

Considered good indicators of the health of aquatic ecosystems, freshwater mussels are dependent on good water quality, good physical habitat conditions, and an environment that will support populations of host fish species (Williams et al., 1993). Because mussels are sedentary organisms, they are sensitive to water quality degradation related to increased sedimentation and pollution. They are also sensitive to habitat destruction through dam construction, channelization, and dredging, and the invasion of exotic mollusk species.

Furthermore, the metrorail corridor site crosses Difficult Creek just upstream from the Difficult Run Stream Valley Park Conservation Site. Conservation sites are tools for representing key areas of the landscape that warrant further review for possible conservation action because of the natural heritage resources and habitat they support. Conservation sites are polygons built around one or more rare plant, animal, or natural community designed to include the element and, where possible, its associated habitat, and buffer or other adjacent land thought necessary for the element's conservation. Conservation sites are given a biodiversity significance ranking based on the rarity, quality, and number of element occurrences they contain; on a scale of 1-5, 1 being most significant. The Difficult Run Stream Valley Conservation Site has been given a biodiversity significance ranking of B5, which represents a site of general biodiversity significance. The natural heritage resource documented at this site is the wood turtle (*Glyptemys insculpta*, G4/S2/NL/LT).

The wood turtle inhabits forested floodplains and nearby fields, wet meadows, and farmlands (Mitchell, 1994). As this species overwinters on the bottoms of creeks and streams, a primary habitat requirement is the presence of water (Mitchell, 1994). Please note that the wood turtle is classified as threatened by the Virginia Department of Game and Inland Fisheries (VDGIF). Due to its protected status, DCR recommends coordination with the VDGIF to ensure compliance with protected species legislation.

To minimize adverse impacts to the aquatic ecosystem as a result of the proposed activities, DCR recommends the implementation of and strict adherence to erosion and sediment control measures during all land disturbing activities.

New and updated information is continually added to biotics. Please contact DCR if a significant amount of time passes before it is utilized.

Please note that the Virginia Department of Game and Inland Fisheries maintains a database of wildlife locations, including threatened and endangered species, trout streams, and anadromous fish waters that may contain information not documented in this letter. Their database may be accessed from www.dgif.virginia.gov/wildlife/info_map/index.html, or contact Shirl Dressler at (804) 367-6913.

Note that federal agencies and their authorized agents conducting regulated land disturbing activities on private and public lands in the state must comply with the Virginia Erosion and Sediment Control Law and Regulations (VESCL&R), Virginia Stormwater Management Law

and Regulations (VSWML&R), and other applicable federal nonpoint source pollution mandates (e..g, Clean Water Act-Section 313, Federal Consistency under the Coastal Zone Management Act). Clearing and grading activities, installation of staging areas, parking lots, roads, buildings, utilities, or other structures, soil/dredge spoil areas, or related land conversion activities that disturb 2,500 square feet or more would be regulated by VESCL&R and those that disturb one acre or greater would be covered by VSWML&R. Accordingly, the sponsoring federal agency should prepare and implement erosion and sediment control (ESC) and stormwater management (SWM) plans to ensure compliance with state law. The sponsoring federal agency is ultimately responsible for achieving project compliance through oversight of on site contractors, regular field inspection, prompt action against non-compliant sites, and/or other mechanisms consistent with agency policy. The Federal Transit Administration is highly encouraged to contact DCR's Potomac Watershed Office and/or the local ESC and SWM authorities to obtain plan development, implementation assistance and to ensure project conformance during and after active construction. *[Reference: VESCL §10.1-567; VSWML §10.1-603.15]*

For your records, no state scenic resources, state recreation resources or state natural area preserves under DCR's jurisdiction will be impacted by this project.

Thank you for the opportunity to offer comments on this project.

Sincerely,

John R. Davy
Director, Planning & Recreation Resources

DATE: October 8, 2004

If you cannot meet the deadline, please notify CHARLIE ELLIS at 804/698-4488 prior to the date given. Arrangements will be made to extend the date for your review if possible. An agency will not be considered to have reviewed a document if no comments are received (or contact is made) within the period specified.

REVIEW INSTRUCTIONS:

A. Please review the document carefully. If the proposal has been reviewed earlier (i.e. if the document is a federal Final EIS or a state supplement), please consider whether your earlier comments have been adequately addressed.

B. Prepare your agency's comments in a form which would be acceptable for responding directly to a project proponent agency.

C. Use your agency stationery or the space below for your comments. **IF YOU USE THE SPACE BELOW, THE FORM MUST BE SIGNED AND DATED.**

Please return your comments to:

COMMENTS

This will acknowledge receipt of your transmittal letter with enclosures requesting Commission review of the above-referenced project.

Please be advised that the Marine Resources Commission pursuant to Section 28.2-1204 of the Code of Virginia has jurisdiction over any encroachments in, on, or over any State-owned rivers, streams, or creeks in the Commonwealth. Accordingly, if any portion of the subject projects involves any encroachments channelward of ordinary high water along natural rivers and streams, a permit may be required from our agency.

GENERAL NOTES:

1. Aerial base mapping furnished under license from VARGIS, LLC, Herndon, Virginia, Copyright 2002.
2. All utilities shown in profile on plan and profile drawings have been compiled from best available information furnished by various utility owners and survey information. Locations are approximate and will be field verified during engineering development.
3. The profile stationing and elements are shown for outbound track unless otherwise noted.
4. Property information shown on Property Identification Plans was compiled from recent public tax records of Fairfax and Loudoun Counties.
5. Horizontal alignments were created graphically on the aerial background base, and are subject to further refinement when developed using the controlled topographic survey that will be completed during the preliminary engineering phase of this project. Vertical alignments were developed using best available topographic information and will also be subject to further refinement during preliminary engineering.
